Computers

Transformation of counting inventions towards wonderland Internet

A demonstration of the full history of the computer and how a chain of counting inventions, social and technical evolution resulted into the fascinating wonderland Internet of today…

1

What's the history of the 'great invention'?

1.1 The earliest counting tools.

Counting on fingers

As long as there have been numbers, mankind has suffered and struggled with counting, also when we were young. So, it is no surprise that he has searched for tools. The starting point was counting on fingers and basic material found in nature around them.

Inca quipu keeper

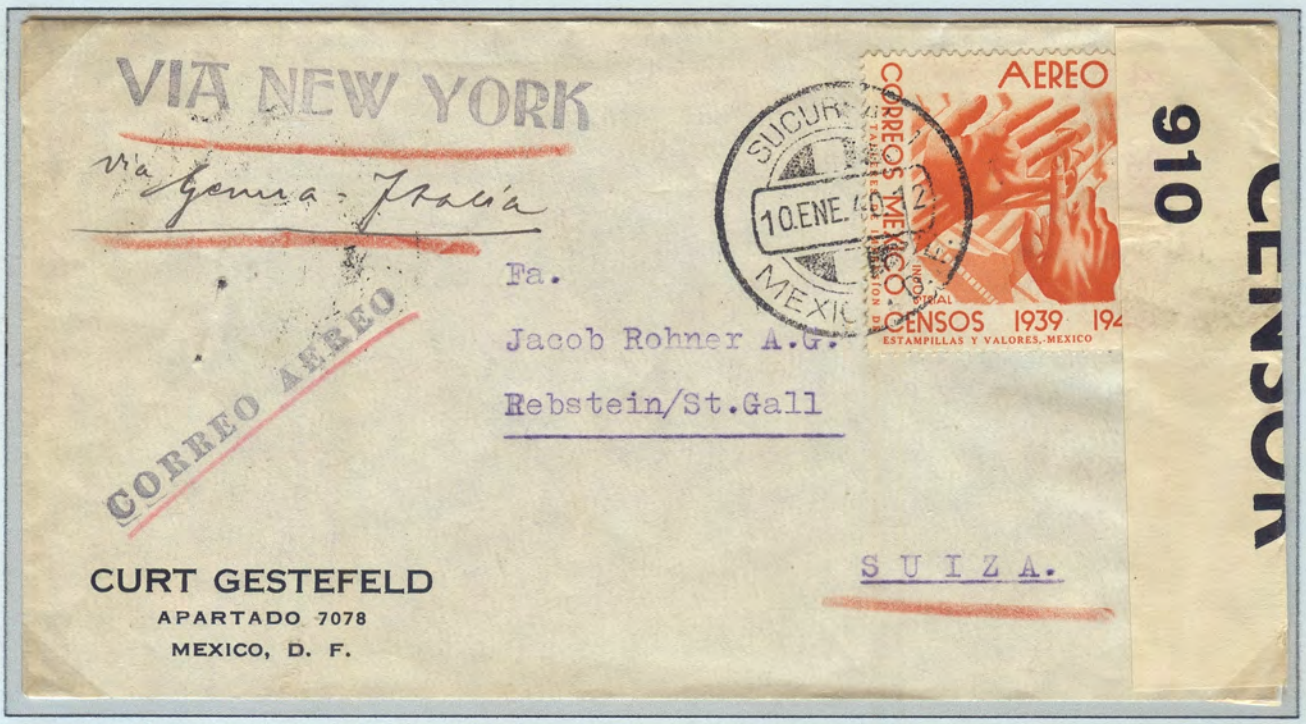
Paintings found in caves have been variously interpreted as counting methods, calendar records, lunar variations or depiction of life.

◄ ▼*proof*

Scribes noting down counts (fragment Theban tomb no.69)

The hieroglyphic system was only suitable for memorial inscriptions on stone monuments.

Other tools like knots in strings, **quipu**, noting on boards or bones are calculating tools used primarily in the ancient time for performing arithmetic processes.



American Censored letter (10 JAN 1940) from Mexico to Switzerland via New York (US) and Genoa (Italy); counting on fingers (the number of stages this letter has done from Mexico to Switzerland; 4 stages)

Stationery (Mexico) finger-counting among Aztecs. Detail of mural by Diego Rivera. (National Museum of Mexico)

Tallying the chimes

Counting on fingers is very temporary or isn't always sufficient when bigger numbers. Over the years more tools like keeping a tally, or calculating tables became common and are even today primary calculating tools.

European table abacus (14th century) variant

Many traders and lords all had their calculating tables showing their importance, wealth and social standing.

The tally of 6 Brabant Sols (pennies) marked on letter from Ostend to Antwerp in 1694; a very usual notation at that time.

Antikythera Mechanism

The **Antikythera Mechanism** was an ancient calculator, which revealed to its owner his position and the position of the Sun, Moon, or other known planets, after entering a date via a crank.

Probably the oldest calculating aid with longest tradition has to be found in the Chinese and Japanese tradition.

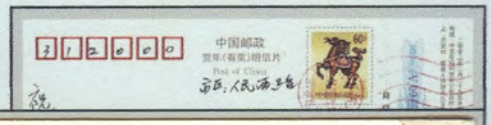
Old Japanese abacus

Because of its long history, the so called abacus is found in many shapes; like boards, metal rods with wooden beads.

Suan-pan

Soroban

The difference between a Japanese **Soroban** and the Chinese **Suan-pan** is the form and the number of beads above and below the wooden partition. The Suan-pan has 2 upper beads and 5 beads below.



Still today many Chinese people carry out every kind of calculation using the abacus (suan-pan) despite having access to electronic calculators; its use is so deeply ingrained in their culture.

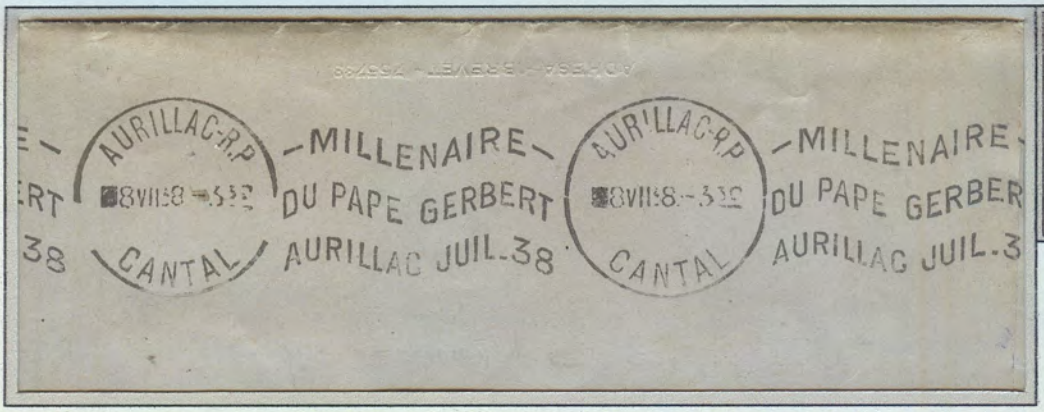
Common abacus, different shapes

A French mathematician, being a French lieutenant in the Army of Napoleon, imported the Russian abacus into our region.

School abacus

Many different shapes, but mostly a vertical frame with horizontal straight wires, found their way in pre-schools and elementary schools, used as an aid in teaching of the numeral system and arithmetic, or why not as a playing tool.

Stationery printed to order (Bayern - 1898)
Abacus as school attribute



Reception cancel Flamme KRAG (France) 8.8.1938 text: Pope Gerbert millennium

Front letter

Pope Silvester II (938-1003), known as monk Gerbert, gave the abacus back the needed attention in combination the 9 Arabic numbers, a lot used in Spain at that time.

colour proofs

The Russian abacus is the grandfather of all the models we know and are used to from school time.

bookkeeper using an stchoty (abacus) calculating the laborers pay bill (N. Verkhotouroff)

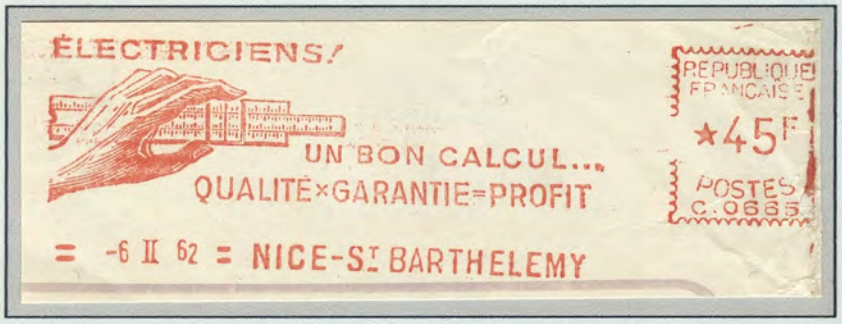
◄ *Stationery - Russia (1929)*

The Russian abacus named **Stchoty,** recognized by the 10 beads on each rod, of which two (the fifth and sixth) are usually of a different colour, which makes it easier for the eye to recognize the numbers from 1 to 10, and two times four white beads, was model for the abacuses we know.

The Scottish mathematician, John Napier (1550-1617) introduced the concepts of logarithms and a simple way to perform multiplication. The Napier 'rods' is one of the earliest attempts of using a new calculator.

John Napier (photo nr 26) created logarithms

Prestige Booklet page ►
(Scotland, Great Britain)



Napier's logarithms resulted in the inventions of the slide rule in 1633. The real breakthrough in its modern form was in 1859. This device appeared in a linear or circular form enables scientists to do calculations quicker.

Postgiro-envelope (France - 1931)

bottom left; circular slide rule

End 1970's it became obsolete by handheld calculators having taken over all of its functions.

Leonardo Da Vinci (1452-1519) made drawings of calculators, but never made a prototype of the calculators he published in his book; the "Codex Madrid I".
Those drawings showed 13 registering wheels and how to propagate a carry to the next digit wheel.

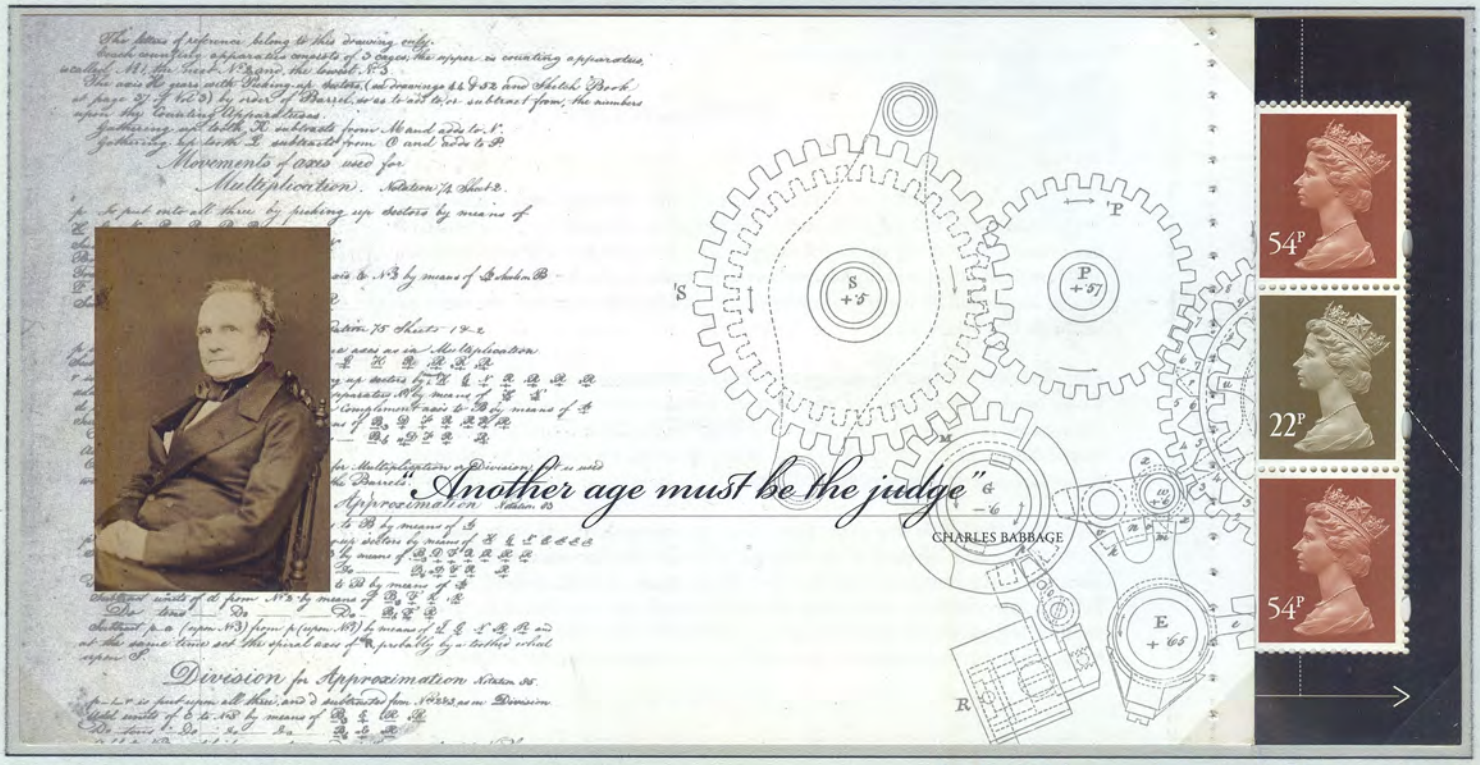
Schickard's machine set to show number 100722 multiplied by 4.

The very first mechanical calculator was built by **Wilhelm Schickard** (1592-1635), professor mathematics and astronomy in Tobingen, was based on the bones of Napier.

Letter Ballon Monté ***'Le Kepler'*** *to London port 30c (**Paris - 10 JANV71** – Paris a Rennes 12JANV71 – London 14JAN71) on flown 11JAN1871; named after famous astronomer Kepler.*

Johannes Kepler

A copy for the famous astronomer **Johannes Kepler** (1571-1630) got lost in a fire. It would have help in Kepler's laborious task of calculating astronomical tables.



Prestige Booklet page (Great Brittain) 'The Royal Society'

Charles Babbage with design 'Difference Engine'

Mathematician **Charles Babbage** (1791-1871) designed 2 models of its "Difference Engine" from 1823 till 1849, an advanced calculator using a large number of gears. He never finished one due to thousands of parts he needed.

Blaise Pascal (1623-1662), born in Clermont, designed and constructed in 1642 the 'Pascaline' at age of 19.

Pascal put several machines into production, but it wasn't successful venture, only fifty got sold. However, this did result in 8 survived to the present day.

Registered at Tours Blaise Pascal ►

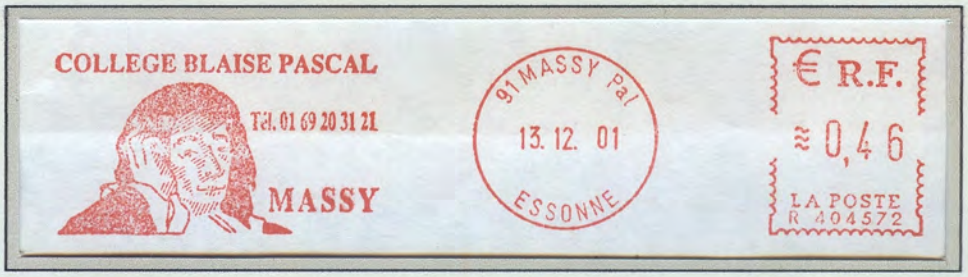
Proof by P.Munier

Misperforation

Pascal received a patent on the arithmetical machine from Louis XIV.

Early usage of cancel dated 11APR1865 bureau (star 29) Rue Pascal, named after Blaise Pascal. Bureau started 1865 till April 1873.

Pascal's portrait wrongly depicts priest Louis Isac Lemeister de Sacy.



Detail stamp: among other scientific studies Pascaline gear wheel

The 'Pascaline' carry mechanism didn't function perfectly. The device came in both decimal and non-decimal varieties.

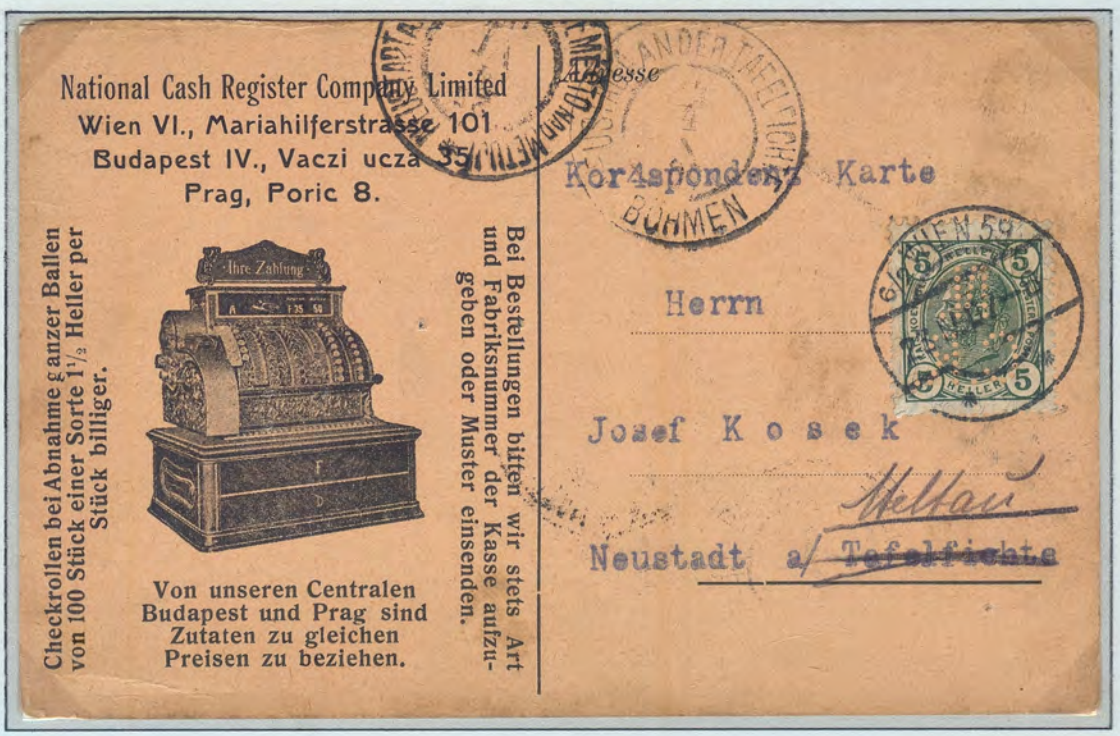
The first cash registers appeared in the market around 1879, as heavy mechanical simple adding machines.

When the cash drawer opens a bell rings

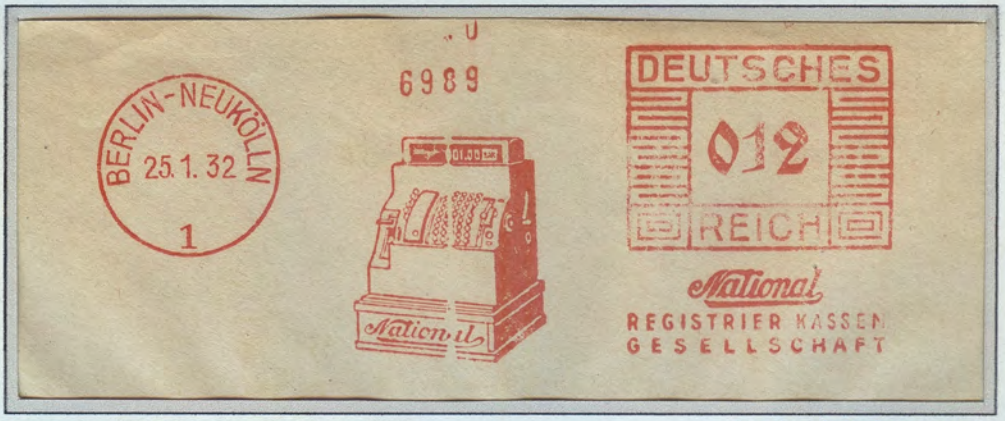
Those cash registers were invented for the purpose of eliminating employee theft. An employee was required to bring in every transaction on the register, and when the total key was pushed, the cash drawer opened and a bell rang, alerting the manager that a sale took place.

Stationery printed to order (Great-Britain); QV 1p sold for ½p - Anglo-Colonial Letter issued Dec. 22, 1888

In 1885 J. Allinson became the first active sales agent in UK and opened in 1886 a London Office, which was established in one room at 95 The Strand under the name of the "National Cash Register Till Co".



*Perforation (Austria - 1907) **N.C.R.** (National Cash Register company) Commercial card sent from Vienna to Neustadt, Germany on 23 April 1907*



Francotyp "B" (German Empire - 1932) National Cash Register

In 1879 James and John Ritty patented a cash register and in 1884 John H. Patterson and his associates acquired the Ritty patents and established National Cash Register Company (NCR). NCR had the biggest market share and sold 2 million devices each year.

Censored letter from New York to Stockholm (4 jan 1944); The US Postal Service introduced in 1931 meter stamps, which were produced by National Cash Register meter model P-1924(3-3)P-P, a multi-value machine.

Although NCR had an extremely dominant position worldwide, it wasn't the only manufacturer. Slowly the competition was growing.

Cash registers followed every evolution in the calculator industry. These calculators have found their way into the common world of stores and warehouses.

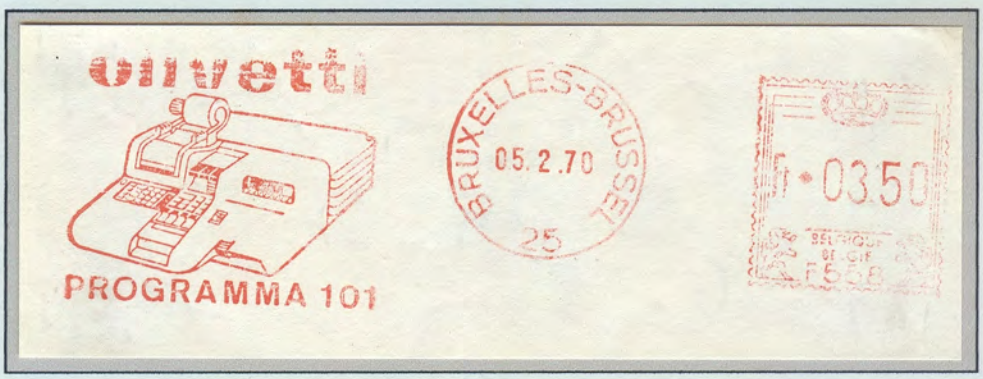
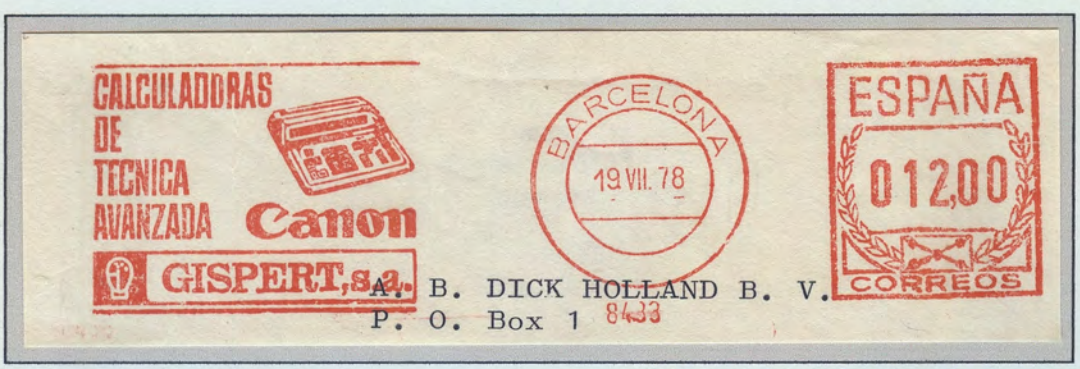
Elka 55

Friden 130; the first electromechanical calculator



The first electronic calculator was created in the early 1960s. Pocket-sized devices became available in the 1970s as the incorporation of ICs reduced their size and cost.



Frama "M/E bzw.100" (Spain)

ill. Canon advanced technical calculator

They became cheap and were able to do more than the four conventional main operations, also able to memorize results, and in later versions able to be programmed by the user.

Stationery (Cuba)

Most students use calculators for schoolwork and become "too dependent" on it; why not learn to calculate in the head.

In 1822, the English mathematician **Charles Babbage** (1792-1871) demonstrated the concept of memory in a form so that his machine (Difference machine) could handle calculations without any human intervention. The idea came as an actuary in an assurance company, from the repetitive calculations he had to do to verify hundreds of tables, and detected a lot of errors in those tables.

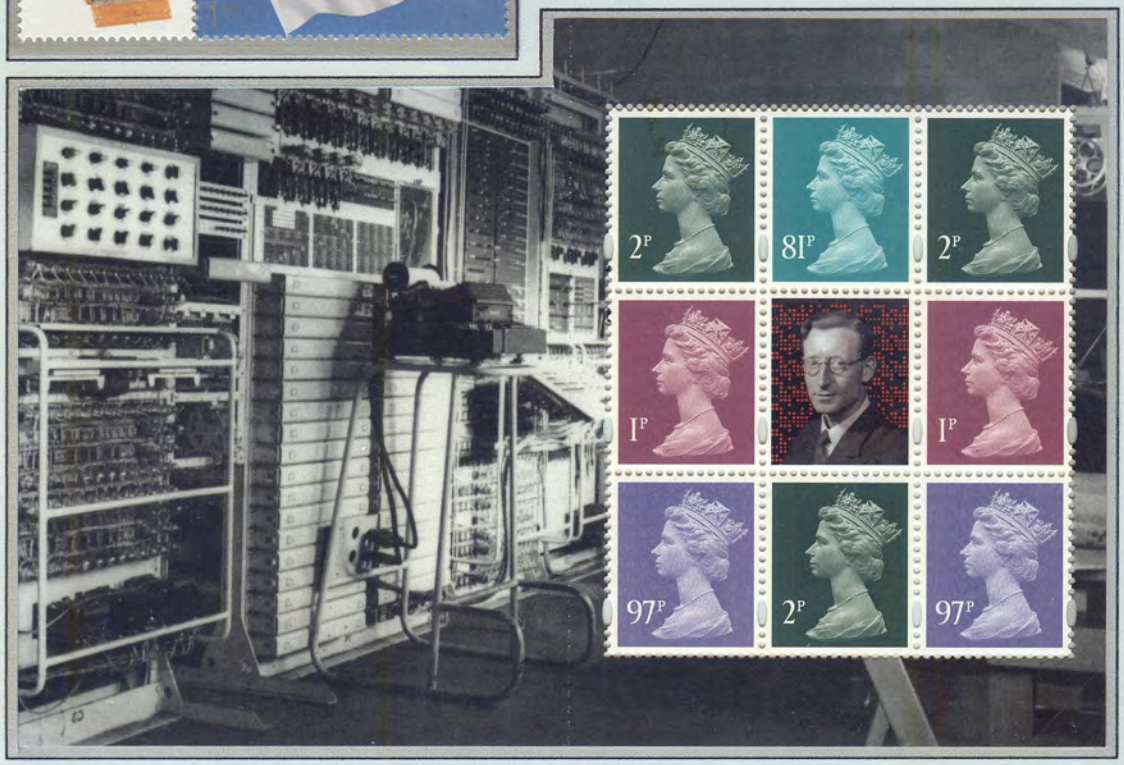
Mulready privately printed (Great-Britain - 1843) According to Babbage this actuarial table with life assurance premiums; containing lots of errors, due to human repetitive calculations, from this he believed this could be avoided when using his Difference Machine.

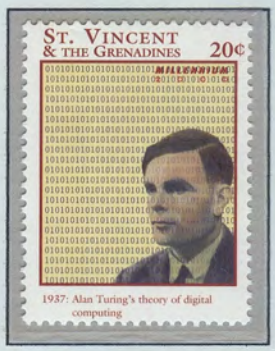
During World War II, the British Government Code and Cypher School at Bletchley Park, outside London, broke the German coded messages generated by the famous **Enigma**.

Rejewskin, a Polish mathematician, and two colleagues, deduced the secret internal wiring of the **Enigma,** but still it was a very time consuming task to break all incoming messages.

Rejewskin (left) and Enigma (bottom)



◄ *pane prestige booklet.*
T. Flowers & Collosus (left)

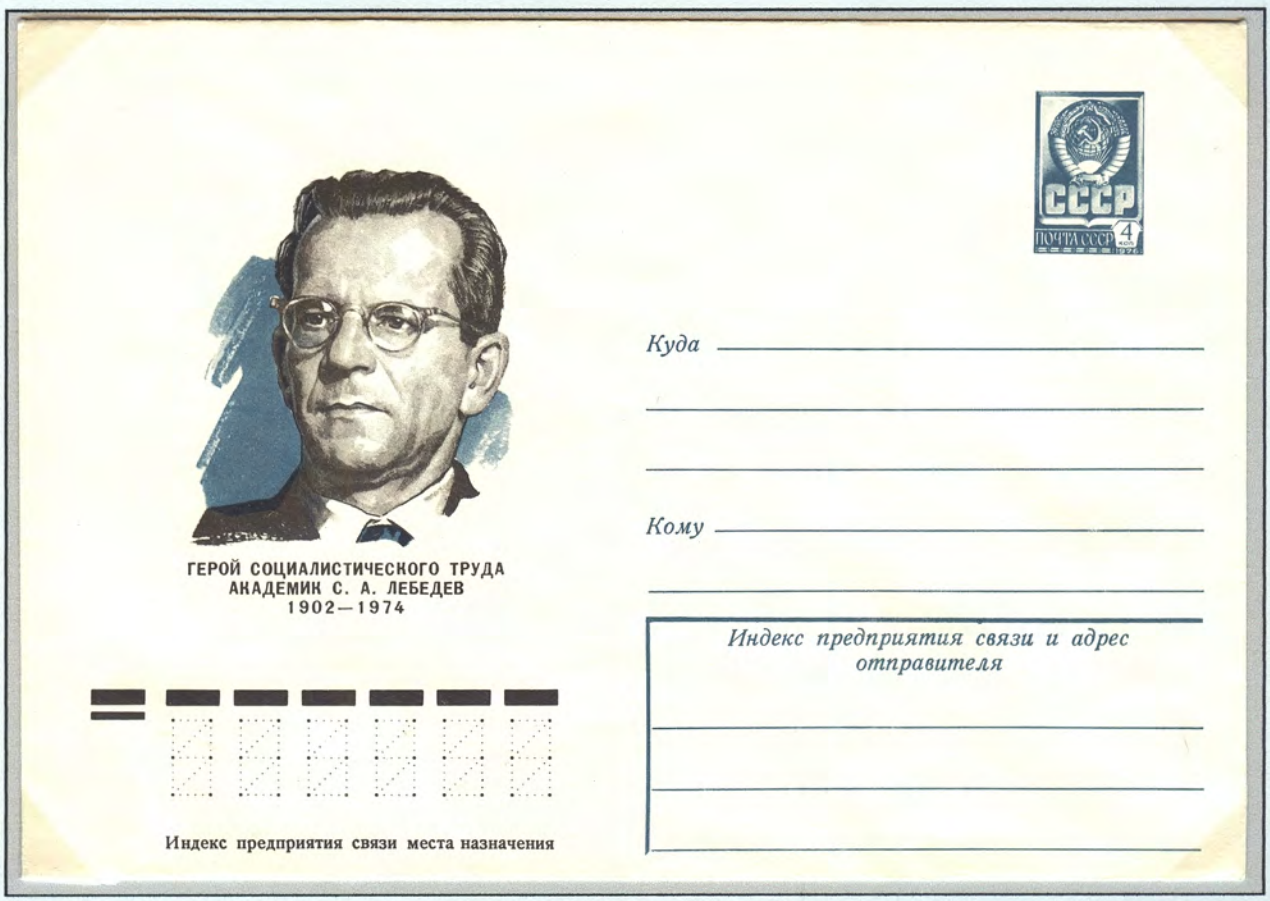


Alan Turing and **Tommy Flowers** build the world's first electronic and programmable computer **"Collosus"**. It got the name because of the big number of vacuum tubes (1850) used to be able to decode the German messages. Ten of those computers were completed and used, and were crucial for deciding start of D-Day.

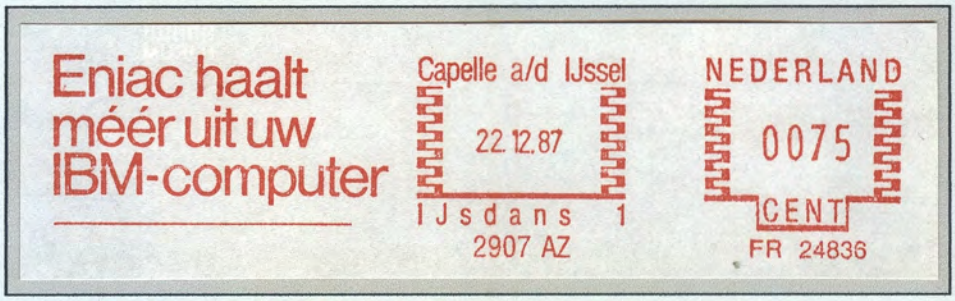
Secret PO box 111 letter (Great-Britain – 4.03.1943): undercover mail address of Bletchley Park, sent via FPO 676 at Inverness, Scotland with RAF censor cancel.

Bletchley Park

During WW II **Konrad Zuse** (1910 - 1995) developed the computers Z3 and Z4 and was the first to demonstrate how to load a program. In 1949 Zuse re-established his own company under the name Zuse KG and completed the Z4. The Z4 can be considered as the first commercial computer in operation.



In 1946 **Sergei Lebedev** (1902-1974) developed as head of the Kiev Electro technical Institute of the Ukrainian Academy of Sciences with his team the first computer in the USSR. The MESM (meaning translated Small Electronic Calculating Machine) had about 6000 vacuum tubes, did fixed-point binary representation, used parallel arithmetic processors and could operate at an average speed of 50 operations per second.



Eniac Company called after the famous first American computer

Meanwhile in the U.S. in 1946 the **ENIAC** (**E**lectronic **N**umerical **I**ntegrator and **A**utomatic **C**omputer) was completed by two American university professors, **John Mauchly** and **Prosper Eckert**, using as first the Babbage concepts.

Shifted perforation

The Eniac, extremely large and heavy (5m x 24m – 30 ton) was developed at the University of Pennsylvania.

◄ *U.S. Postal Service issued below stamp commemorating the 50th birthday of the ENIAC and the computer technology that have followed*

cancel Aberdeen Proving Ground, Maryland 24.04.1951 ►

In 1947 it was transferred to U.S. Army Ordnance Corps in **Aberdeen Proving Ground**, Maryland, where it was in continuous operation until October 1955 to support the American ballistic research lab. It was able to calculate a trajectory in 30 seconds that took a human 20 hours.

Dr. Atanasoff, from Bulgarian origin, and graduate student C. Berry built successfully the **A**tanasoff-**B**erry **C**omputer (ABC) at Iowa State College during 1939-42. The machine was only capable of solving up to 29 simultaneous linear equations, further development stopped due to WW II assignments.

An American mathematician with Hungarian roots, **Johannes von Neumann** (1903 - 1957) engineered the first computer that loaded a stored program into memory and executed it. This machine, called EDVAC (Electronic Discrete Variable Automatic Calculator), was created at the University of Princeton.

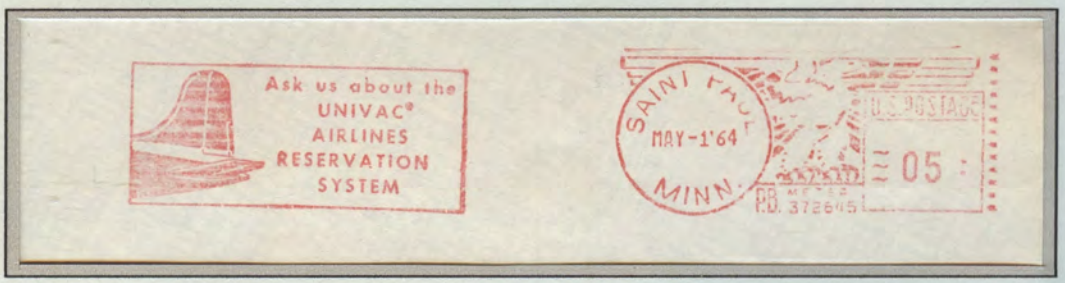
Francotyp "Cc/Ccm" (Sweden) ►

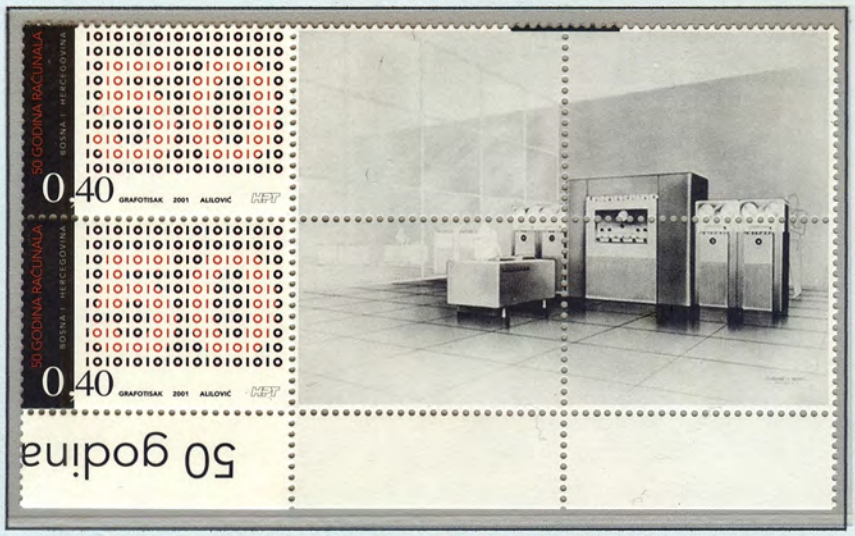
In 1951 the first commercial computer was successfully developed, the **UNIV**ersal **A**utomatic **C**omputer (UNIVAC). It was part of the so-called 'First Generation Computers'; they were built with tubes.

Magenta color missing

In 1955 Lawrence and Elmer Sperry, founders of the Sperry Corp., acquired the Eckert-Mauchly Computer Corp. and Remington-Rand, developers of the Univac system. The company name changed to Sperry Rand and later (1986) merged with Burroughs and exists today under the name of UNISYS.

The Univac airlines reservation system (part of USAS) is still in use today but is slowly diminishing and is being replaced with Open Source and Front-End products.





"Fifty years computers" UNIVAC exists 50 years

The second generation of computers (1958-1964) is identified by the use of transistors instead of tubes, enormous reduction of used space, use of higher level of computer languages, tape-devices and removable disks. The third generation computers (1964-1970) use integrated circuits, which result in dramatic reduction of power and space. A lot of attention goes to high availability and stability.

Die proof (Ivory Coast) design by P. Forget Mainframe **IBM 360/40** model; bottom right Magnetic core memory

This generation was completely dominated by IBM's first commercialised "computer family", the **IBM/360** series announced in 1965. Lots of major companies were buying and using these systems. In the beginning IBM didn't believe that companies would spend that amount of money in computers. The successes of the **UNIVAC** took away every doubt, and IBM started a big campaign. In 1956 it became number 1 and is still today a market leader in the computer business.

3rd Generation CPU; EC 10xx series

German Company Robotron

The fourth generation computers started around 1970 having IC's that contain many processing circuits. Also Timesharing was introduced, being the optimal use of the processor power and time by dividing it between all users of that CPU. This allows many users to work at the same time on a single computer.

On March 8, 1983 IBM launched their "Personal Computer", the IBM PC XT with an 8088 processor, as product number **5160.** XT stands for e**X**tended **T**echnology.

*Double print central image **(VÖB exp)***

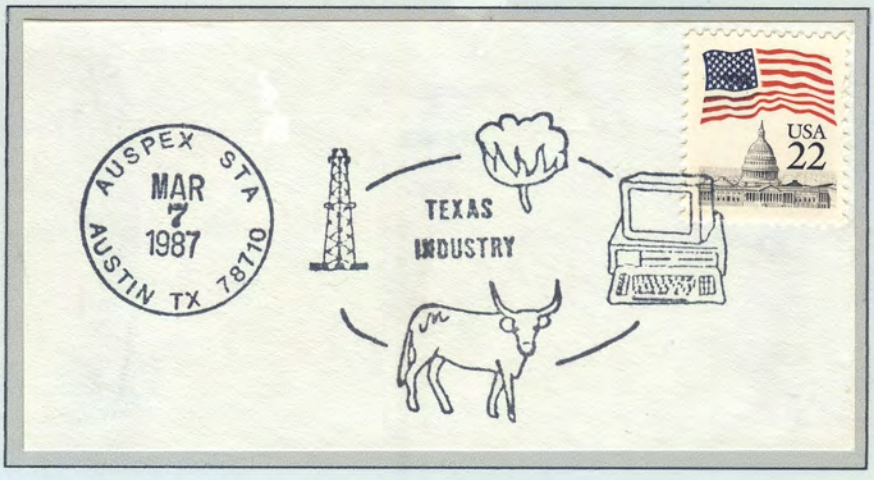
IBM/XT was the first computers with standard hard drive and a BASIC operating system.

▲ *Echo card (Japan)*
IBM PC 5550 is the Asian version of the IBM PC XT, with special more powerful processor for eastern languages.

▲ *Specimen meterstamp SECAP model S (France)*

Olivetti M24 (8086 processor)

Eighteen months later the new architecture was a proven standard and got more than 50% of the market share. Thanks to many other manufacturers like e.g. Olivetti.



From then on everybody talked about PC or home computer that replaced the word microcomputer.

Francotyp "Cc" (Israel) ►

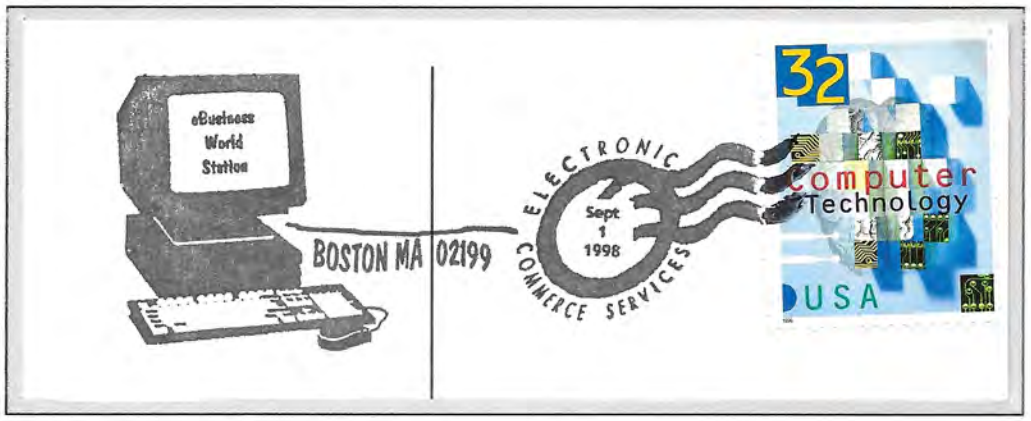
After the XT came the AT PCs, second generation PC. AT stands for 'Advanced Technology'. It was a more robust system having a 286 or higher type processor, a 20MB hard disk and more advanced graphical interface.

IBM's efforts to trademark the name AT largely failed and many computer manufactures copied the 286-based architecture, called clones. Most systems with processor types 286, 386, 486 and Pentium CPUs, and at least some with Pentium Pro and Pentium II processors, were describable as AT-class. A processor is needed for processing the programmed instructions.

Private Booklet (Israel:

IBM PS/2 (Personal System/2) with 2 80286 processor

The PS/2 line was created by IBM in an attempt to recapture control of the PC market by introducing an advanced yet proprietary architecture, which was not a big success due to its hardware incompatibility.



In the PC-world the processor type is one of the major differences. The processor speed is dependent on the type of the processor types; following types exist 8086, 286, 386, 486 and 586 (Pentium) processors. The Pentium processors empowered with dual or quad core technology.

Personal Computers don't differ that much from big mainframes; besides the fact that PC's are much smaller, there is a major difference; a PC reacts on the movement of the mouse and the mainframe only reacts after the "enter"-key is hit. The result is that PC programs can be user-friendlier.

Robotron A512C

Portable computers appeared on the market shortly after the introduction of the Personal Computer. In the beginning they were transportable because the screen, keyboard and processor were integrated in one box.

With the introduction of the flat screens the LAPTOP became flat, slim and very light (few kg).

A Laptop of TOSHIBA model J-3100SL

The word LAPTOP exists out of LAP and TOP. So, it is a PC that you can put on your lap.

◄ ▲ Magnetic core memory; bottom right

core memory (right)

Typically for the second-generation computers was the use of magnetic cores memory. It was introduced as central storage memory. Cores can be magnetized, and can be read again by detecting if a core contains a 1 or 0; meaning a core is loaded positive or negative.

Magnetic core memory

Jack Kilby

Microchip 600X enlarged

Specimen (Mexico) partial successful perfin MUESTRA

The third generation of computers appeared in 1965. They started to use Integrated Circuits (IC), invented in 1959 by **Jack Kilby** of Texas Instruments. The evolution of 'chips' went very fast. By the beginning of the 21st century, the ICs had over 100 million transistors on it, with the total number of components including resistors, capacitors, and conductors being even larger. Result of increasing efficiency and compressing on each mm² and less power consumption.

Hasler "Smile" (Netherlands)

Integrated Circuit (IC)

Those microchips were massively in use since 1971 as central memory, processor and control.

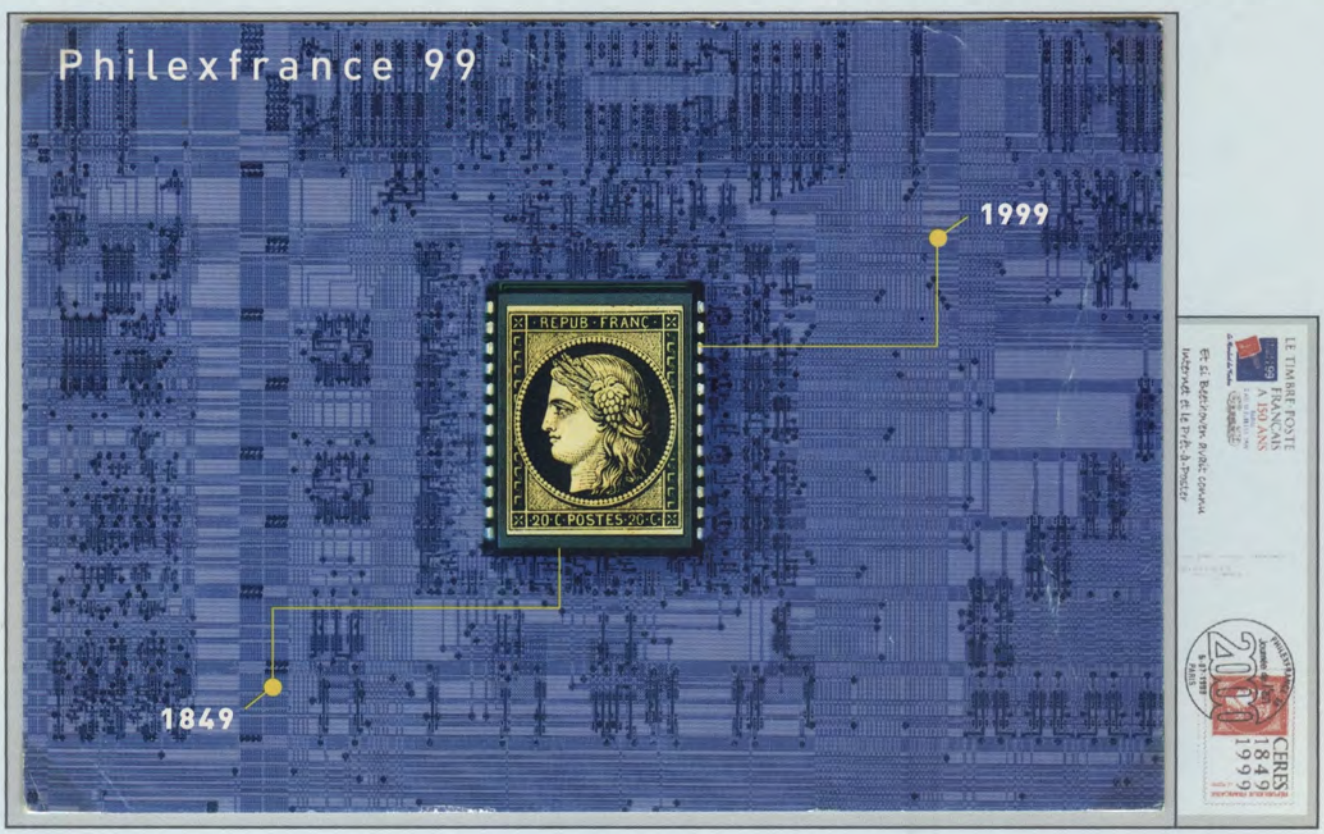
◄ *Color trial proof (Monaco):*
Integrated Circuits (ICs)

The speed of the computers is now measured in millionths of a second, the term MIPS is born; **M**illions of **I**nstructions **P**er **S**econd.

*Letter sent as **"PD"** from Guyanne Cayenne on 17.11.1864 rated 70c and canceled with 64-dot losenge arrived in Toulon, France on 16.12.64, via Paris 14.12.64, Paris Gare de Lyon 14.12.64 and Nice 16.12.64.64 - representing a quad-core 64-bit processor; every dot is a bit and can be either 1 or 0, also can address 2^{64} bytes in memory.*

Adding another board containing dozens of ICs was an easy way of extending a computer.

Today's ICs have **quad-core 64-bit** processors, meaning 4 independent units can read and execute central processing unit (CPU) instructions such as add, move data, and branch. Each core operates in conjunction with other circuits such as cache, memory management, and input/output ports. With respect to hardware, 64-bit is referencing the width of the registers on a computer's microprocessor or memory.



2.2 The oldest input device, the keyboard.

Maybe we don't realize but the typewriter stood model for the computer keyboards of today.

The typewriter, invented by **Peter Mitterhofer** (1822-1893) in 1864 and was put into production begin 1870s.

The first models like **'Caligraph'** had a 'full' QWERTY keyboard to avoid keys to jam and typed only in capital letters. Typing 'blind' was required; to see the writing the typist had to lift up the carriage.

Registered letter (Austria) cancel

typewriter 'Yost' based on Sholes & Glidden typewriter with double keyboard.

A practical commercial machine was produced in the United States in 1867 by Christopher Latham Sholes and was manufactured by the Remington Company and placed on the market in 1874. All typewriters also able to type small letters were given a double keyboard with in total eight rows of keys: three for lower case, three for upper case and two for figures and symbols.

LIQUORE STREGA

UFFICIO EMISSIONE BUSTE-LETTERA POSTALI
A FAVORE DELLA FEDERAZIONE DEI COMITATI DI ASSISTENZA AI MILITARI CIECHI, STORPI E MUTILATI
ROMA

Copy recto

On. Signore,

Per speciale concessione governativa, ratificata con Regio Decreto N. 1678 del 29 Ottobre 1920, sono state messe in circolazione le Buste Lettera Postali simili a quella su cui scriviamo: esse hanno avuto la più entusiastica accoglienza da parte del pubblico.

Le Buste-Lettera, affrancate con francobollo speciale, vengono vendute ad un prezzo inferiore di cinque centesimi al valore nominale del francobollo appostovi; sicchè, con l'uso di esse, il pubblico viene a risparmiare su ogni lettera cent. cinque di francobollo oltre ad aver gratis la busta e la carta.

In questi tempi in cui tutto rincara è un bel miracolo operare un ribasso di tal genere: cedere cioè un francobollo di quaranta centesimi per trentacinque e regalare inoltre la busta ed il foglietto.

Ci si chiederà come avviene ciò e la risposta è facile indovinarla: gli annunzi di pubblicità operano il miracolo!

La concessione governativa è a favore della Federazione Nazionale dei Comitati di assistenza ai gloriosi mutilati di guerra e l'iniziativa, che riveste un nobile contenuto, è destinata al più largo successo per l'enorme diffusione delle Buste-Lettera.

Alla S. V. non sfuggirà quale e quanta efficacia abbiano le inserzioni pubblicate sulle Buste-Lettera che vengono emesse in serie ed in modo che un

Scopo precipuo della Busta-Lettera è quello di diffondere la pubblicità assolutamente seria, che, fatta con questo nuovo e geniale mezzo, riesce superiore ad ogni altra che si possa immaginare. Basta pensare infatti che le Buste-Lettera arrivano dovunque; che ogni copia passa sotto gli occhi di parecchie persone; che penetra in ogni classe sociale; che viene conservata; per convincersi della sua efficacia come medium pubblicitario. Le inserzioni poi sono disposte in modo tale che si debbono assolutamente vedere.

Convinti di fare cosa utile a codesta spett. Azienda, chiediamo alla S. V. di voler studiare la nuova forma di pubblicità che abbiamo l'onore di proporre.

Per aver schiarimenti, copie di ordinativi, tariffe, che non impegnano in alcun modo, preghiamo di inviarci la cartolina di ritorno, che va staccata ed affrancata come stampe, e costituisce un altra utilità delle Buste-Lettera Postali.

Indirizzare: UFFICIO EMISSIONE B. L. P. MINISTERO PENSIONI, Via Veneto 50 - ROMA - e curar di scrivere nello spazio riservato al mittente il proprio indirizzo.

In tale attesa, ci è grata l'occasione per inviare distinti saluti e ringraziamenti.

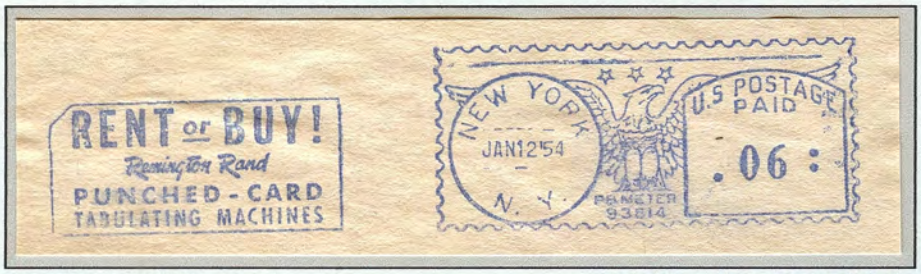
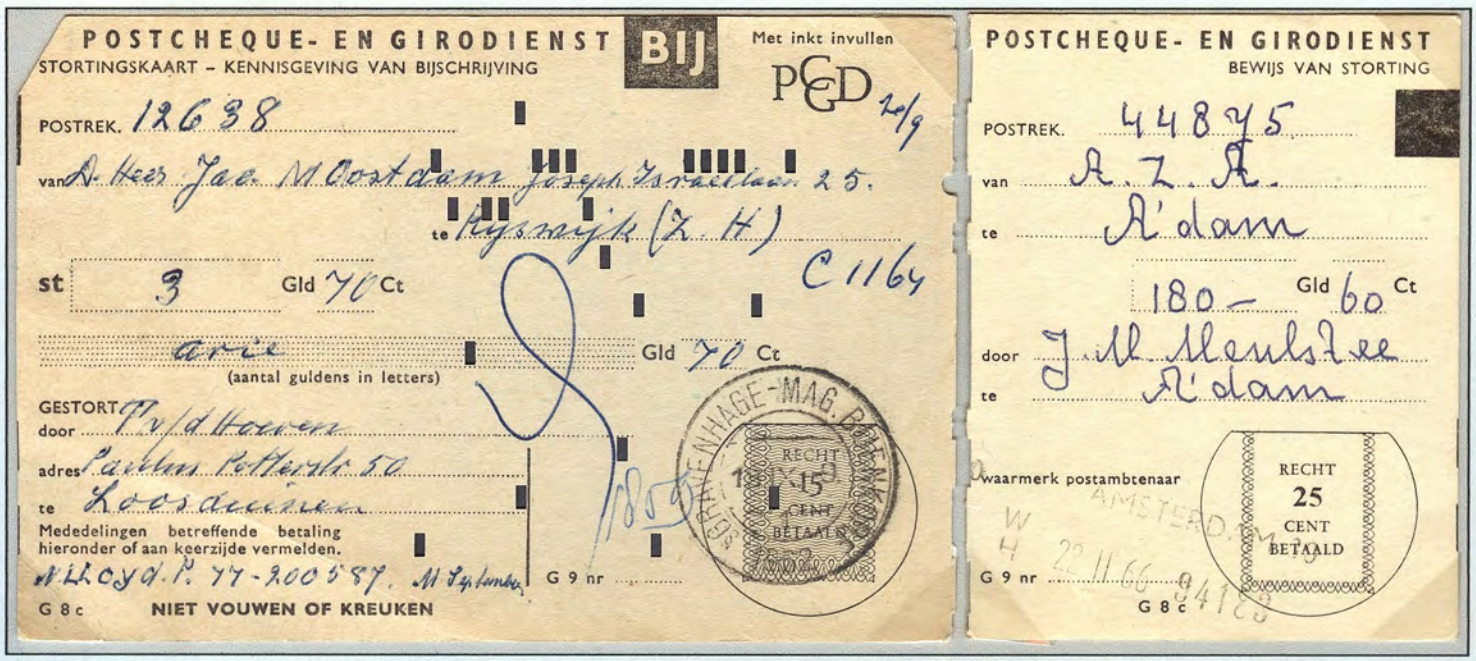
Up to the 1980s data and even programs were read in with this medium thru punch card readers.



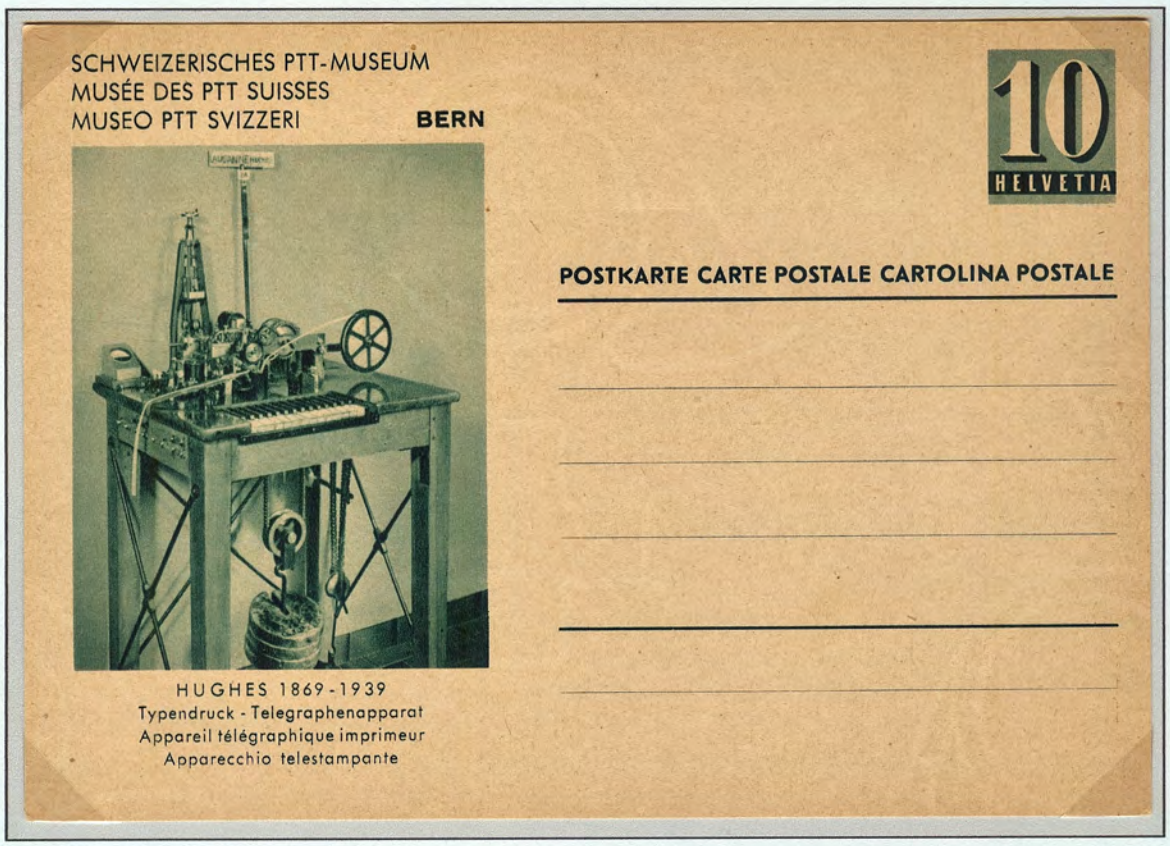
Pitney Bowes (US – 1954) punch card Remington Rand

Punch card reader (left)

High-speed sorters and readers could process up to 650 punched cards a minute.



Deposit card G8c has IBM 80-column format and uses the Hollerith-system. Used from 02 October 1961, for depositing money. Notification description was coded (see punch holes) for automatic processing of the data. Right part, proof of deposit, was send to the payer. There are 7 different versions of this payment card, including denominations for three tax increases. The printed values were appearing alternating on the left or right part. This payment method was no longer used starting on 30 July 1966.



E. Hughes

The paper punch tape is better known from the telex world. The telegraph and newsagents have used for many years a machine, called *telewriter*, an invention of **E. Hughes** (1831-1900) in 1855.

IBM 1621 punch tape machine

Punch tapes have always been used as input and output devices. In the late 1950s when speed became more important and the capacity wasn't sufficient anymore, a switch was made to magnetic tape. It was still in use by the telex users till beginning 2000s especially in the US.

Color proof with notes of color numbers used (France)

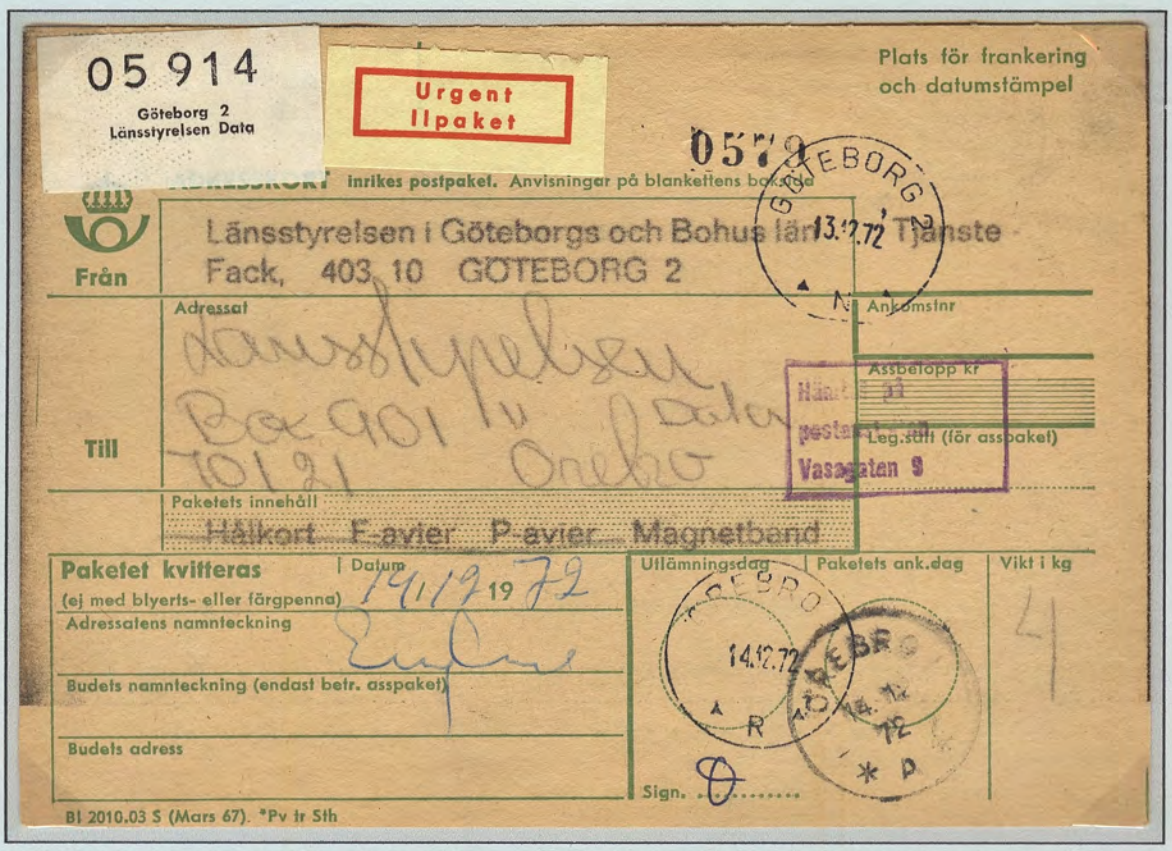
left; IBM 1621 punch tape machine

2.4 The paper punch tape and the magnetic tape.

Magnetic tape was in the beginning only available on a spool. It was for a long time the most used storage medium, especially for backing up and storing programs.

It allowed companies and organizations to store data in a very inexpensive way.

Tapes were portable and could be sent around the world without data loss, but today magnetic tapes are available in cartridges, in which they are better protected against damages.



Official parcel service card for a 4kg package, marked urgent, containing holerith cards and magnetic tapes. Sent 14dec1972 from Göteborg to Örebro

2.4 The paper punch tape and the magnetic tape.

A tape unit unrolls a tape from one spool to another spool, while it can read or write the data or instructions on that tape.

Magnetic tape contains very small magnetic particles put on a plastic carrier (tape). Those particles can be magnetized (storing data) with information.

The speed of transfer can be a few hundred thousand bytes a second, but is considered as too "slow" today.

Stationery cassette post (Egypt); facility for private individuals to send spoken messages on cassette tapes to their relatives and friends.

The first personal computers used the classic music recording cassette as a cheap storage medium to store data and programs. It evolved to tape-streamers for daily and/or weekly computer backup.

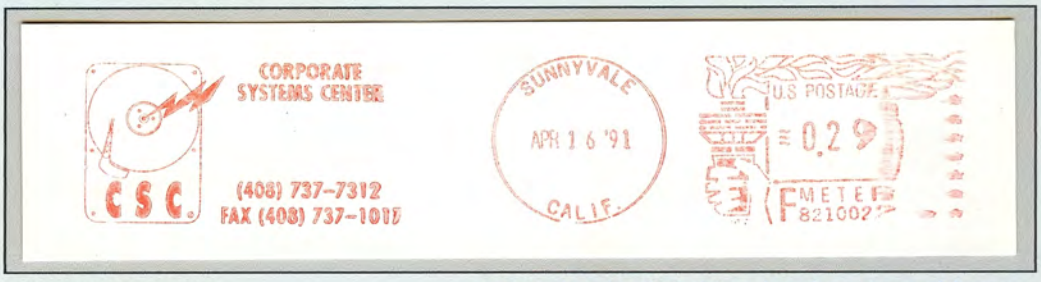
2.5 From disk to floppy, from CD to Cloud.

A memory device, such as a floppy disk or a hard disk is covered with a magnetic coating on which digital information is stored in the form of microscopically small-magnetized needles. Data is read and written by a disk drive that rotates the discs and positions the read/write 'heads' over the desired track(s). The latter radial movement is known as 'seeking'.

▲ Removable disks ▼

Pitney Bowes "6300 series" (Germany)

Removable disk



Friden 9258 (USA)

internal sight disk drive, heads on moveable arm

Today billions of bits of data can be stored on those disks. The **removable disks** are replaced by fixed redundant inexpensive or independent hard drives (RAID). This provides high availability and secured data access protected by system microcode.

5.25 inch diskette; flexible cover (protective jacket) and a capacity of 360KB to 1.2MB

A **floppy drive** for **diskettes** was standard in every personal computer with a hard disk till 2005. A floppy disk can store data. A floppy drive can be recognized by a covered slot at the front of a PC, where de diskette can be brought in or later removed. By 1996, there were an estimated 5 billion floppy disks in use.

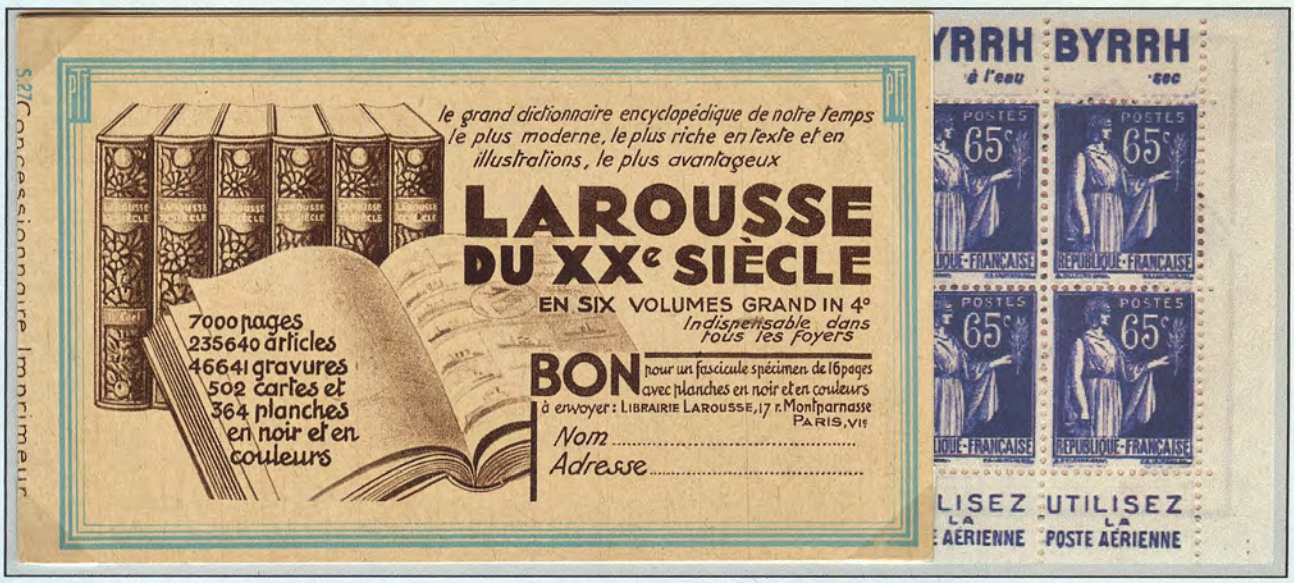
3.5 inch diskette; hard cover (better protection) and a maximum capacity of 1,44MB.

2.5 From disk to floppy, from CD to Cloud.

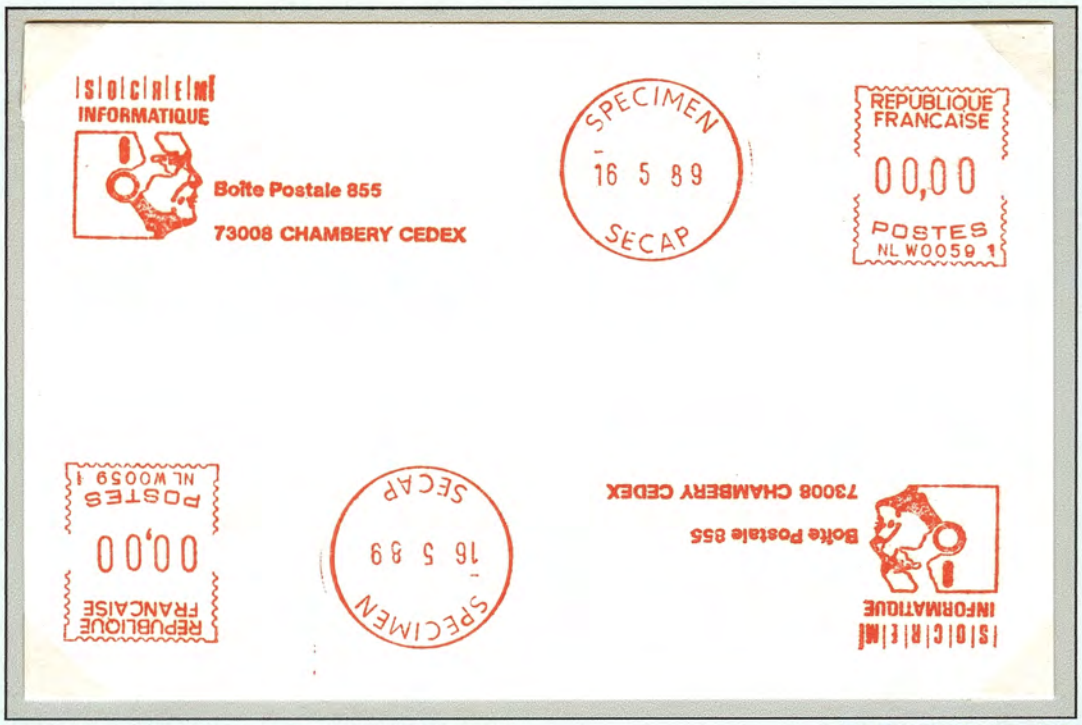
May 16, 1960, **Arthur Schawlow** and Charles Townes outlined the working principles of the laser beam technique, which was derived from the microwave technique. Finally the laser technology expanded continually in the world of science, medicine, industry, and entertainment resulted in different fiber-optic compact disks.

Francotyp "Cm7000/10000" (Sweden) A CD-ROM disk can store 250.000 A4-pages

Today CD-ROM (**R**ead **O**nly **M**emory), CD-R (**R**ecordable), CD-RW (**ReW**rite) and DVD (**D**igital **V**ideo **D**isk) are often used for music, video, software and encyclopedias.



A compact disk can easily contain an encyclopedia as Larousse with all its articles and images, up to 650 megabytes (6500 x 2^{20} bytes; being 650 x 1048576 bytes or about 250.000 A4 pages text) of data.



Meter Stamp Specimen type SECAP (France)

5.25 inch floppy disk

The floppy disk or flexible magnetic disk revolutionized computer disk storage for small systems and became ubiquitous in the 1980s and 1990s in their use with home computers to distribute software, transfer data, and create backups and archives.

USB flash drive, symbol USB in tab (right)

Internet

Archives

Cloud

Today the traditional storage have now been superseded by USB flash drives, external hard disk drives, CDs, DVDs, SD cards and became invisible by computer networks, internet or in the Cloud.

Evolution of different media; punch card, tape, Floppy, CD to flash drive and SD card

The printing (r)evolution started long before the computer age, in 1436 Gutenberg's work on the printing press, spread rapidly across Europe thanks to the high quality and relatively low price, always searching for quicker and more efficient way of reproducing text and image.

Word 'printer' derived from printer profession

Francotyp "Cc" (Belgium): missing town + date mark

Carbon paper

Commercial impact and regulations forced companies to fulfill more and more paperwork. First written on preprinted paper, and then later fully typed on typewriters, using all kind of tools to reproduce more and quicker, like carbon paper twisted between two sheets of paper copying the text easily.

Preprinted Paper ▶

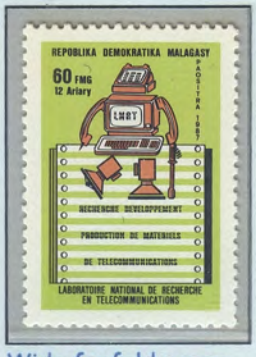
Also stencil technique (spirit duplicator) often used when high volumes were needed and typewriters were involved.

Strike post from Great-Britain (8 Feb. 1971); it was approved in that period to special private postal services to produce and sell stamps; stamp produced by the stencil technique.

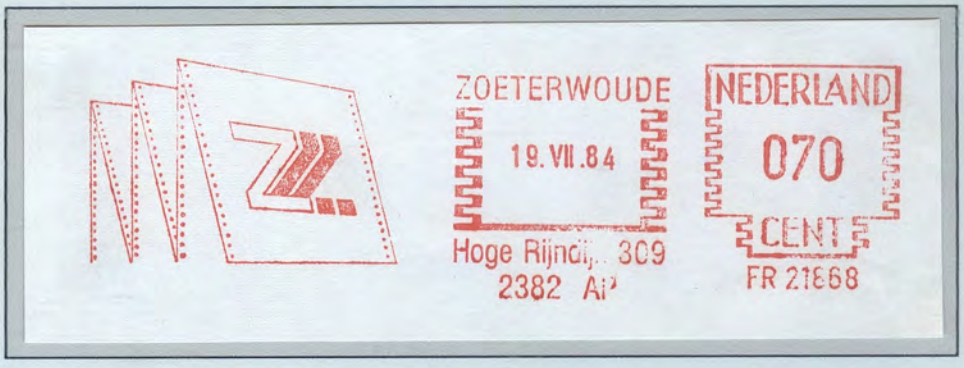
teleprinter

SECAP prefix "NE" (France) Typical computer with printer setup; printing on fanfold paper

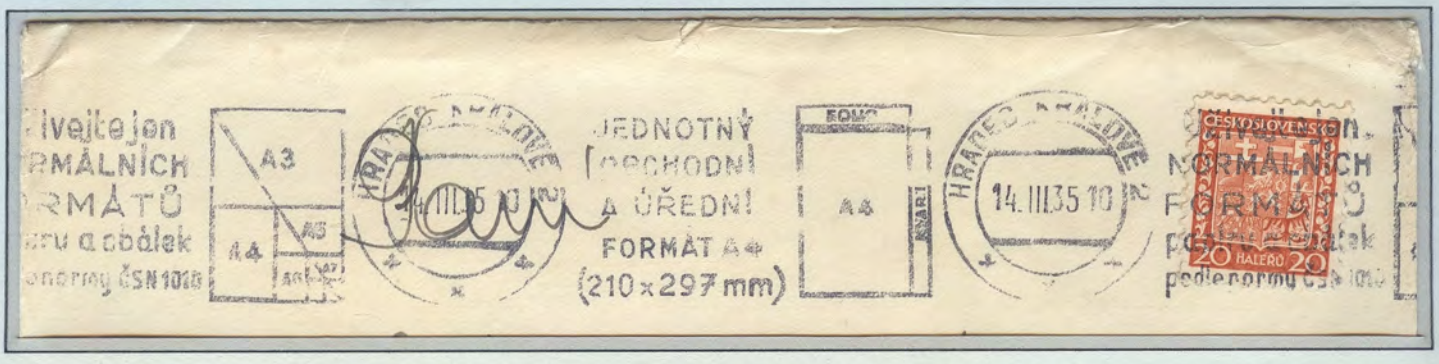
A printer is an output device that started as a "teleprinter" used in the telex world. Text or drawings coming from a computer are printed on paper.



Wide fanfold paper



In the early years wide fanfold paper was most commonly used with impact printers like line and dot matrix printers. The continuous paper with edge perforations is moved through the printer with sprocket wheels or toothed belts.



Today all European laser and inkjet printers are using standard paper sizes like A4 and A3. A4 (210 mm x 297mm) is part of an official metric standard. It was set in 1975 and is based on a German standard originally from 1922. The key feature of this paper size is that A4 is half the size of A3, A5 is half the size of A4.

Since introduction of e-readers and tablets more and more people are working paperless or greatly reduced it.

Line printer quality

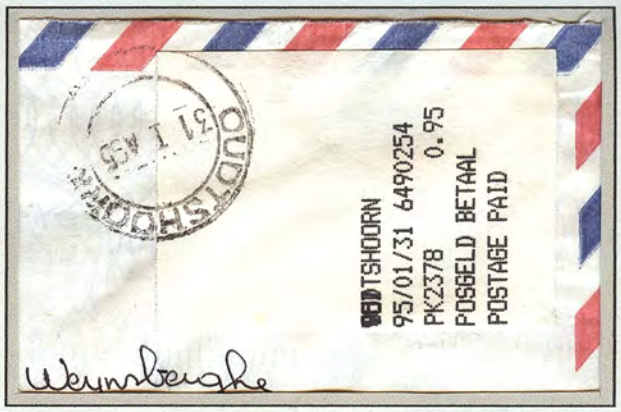
Fragment block (Belgium) 3D-print out in plastic

3D-printers are the next printer generation. They work like inkjet printers by extruding small beads of material (like plastic, metal) which harden immediately into forms created with a computer aided design (CAD) packages.

2.6 All the differences in printing.

▲ *dot-matrix printers* ►

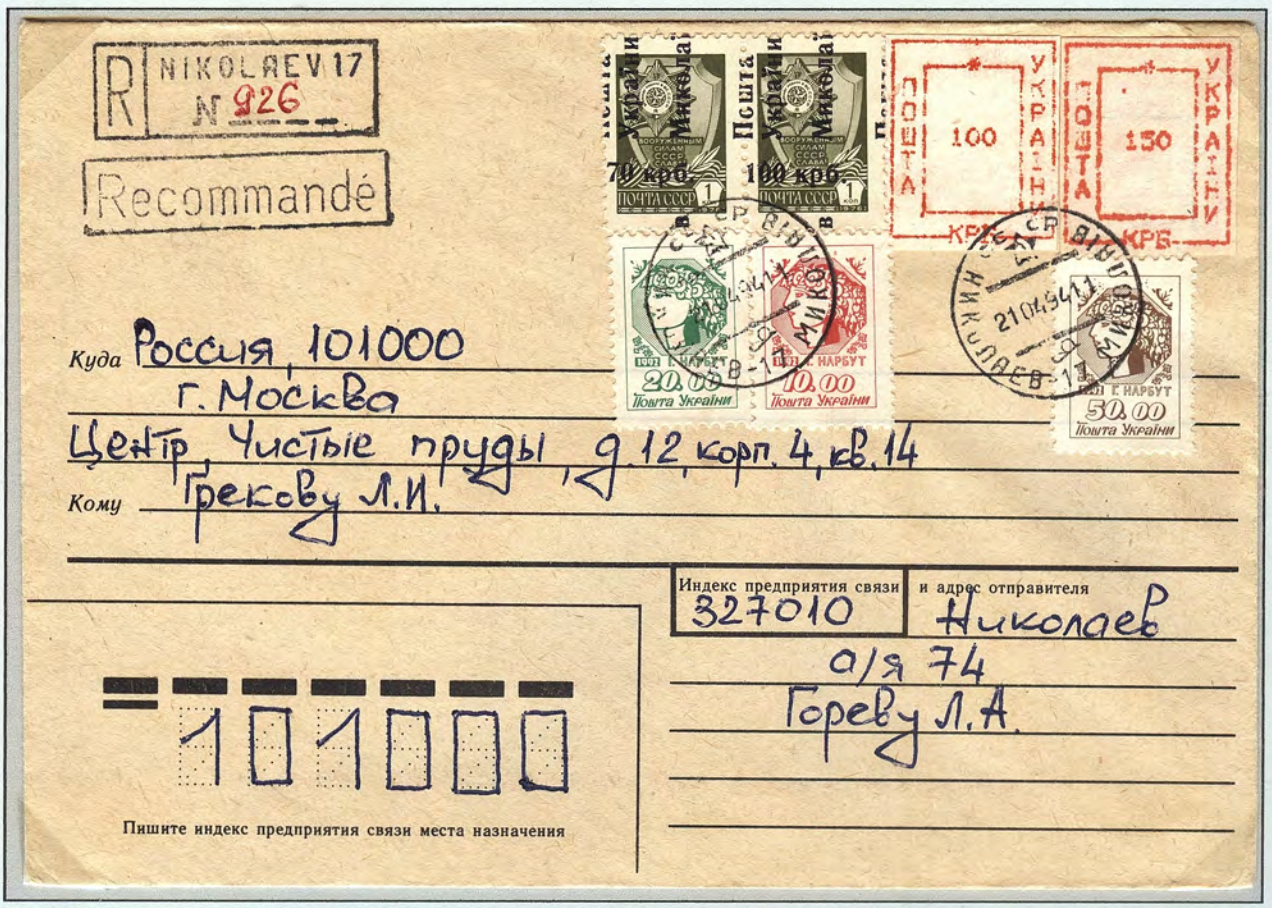
▲ *pre-printed registered label (Israel): text printed with a 9-needle dot-matrix printer using purple ribbon.*



white dot-matrix printer label on letter from Oudtshoorn near Cape Town (South-Africa)

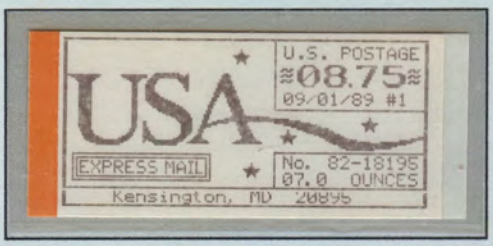
Dot-matrix printers have a vertical column of up to 48 small closely packed needles or pins each of which can be individually forced forward to press an ink ribbon against the paper.

The print head is repeatedly scanned across the page and different combinations of needles activated at each point. Dot-matrix printers are noisy compared to non-impact printers like laser or inkjet printers.



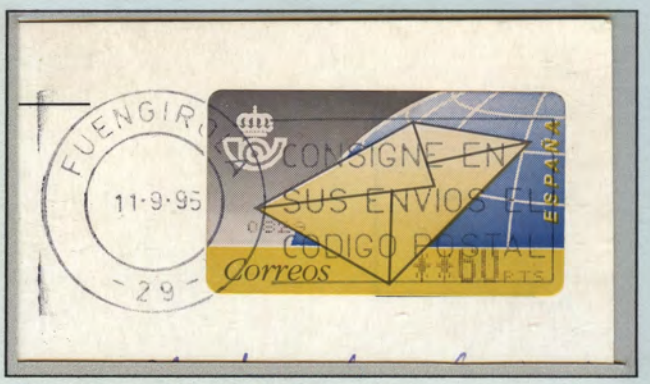
The Nikolaev (principal town of Ukraine) so called computer stamps are printed with a common 9-needle dot-matrix printer. Due to a shortage of stamps in the period of 1992-1994, because of the independence of Ukraine, a lot of those regional (local) stamps were produced. They exist in black and red printed postage and with different values.

Print out on 1st Class stamps (Great-Britain) of printer test of a self-service payment NCR VK80 thermal printer widely installed in post offices.



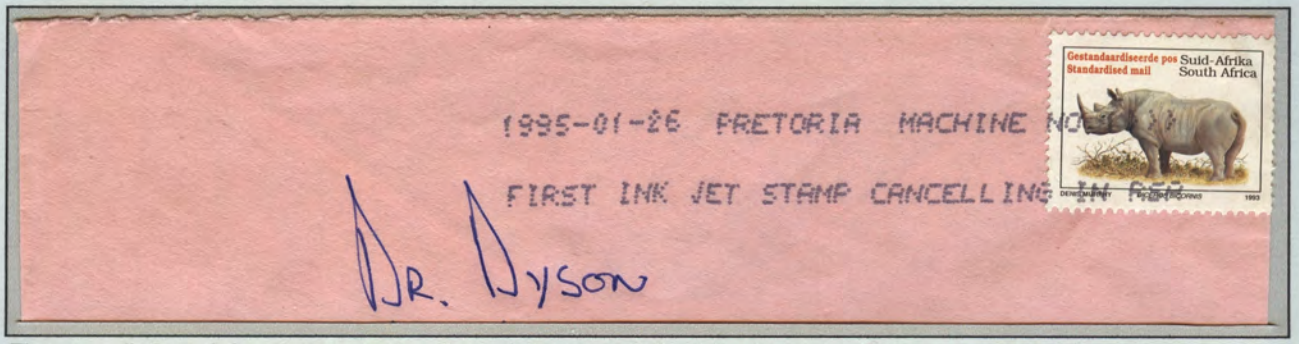
Thermal transfer print used at the 'Autopost' experiment, a self-service postage vending machine. The stamp is printed at selling time. Tests have taken place in the congressional post office in Washington, D.C. and Kensington. After a lot of problems the experiment was cancelled.

A thermal transfer printer uses thermal wax ribbon or paper. During the printing, paper or ribbon is heated on those spots where printing is wanted. These printouts can be used in environments of higher temperatures.



Thermal transfer print (Spain) example

Thermal printers are cheaper and use continuous paper and ribbons which cost more.



The cancellation of the stamps on the above letter was realized by the cancellation machine JAIME 1000SA having a build-in inkjet printer, that can automatically print current timestamps, and 25 different slogans (max length of 140mm). Printing speed is about 4 meter/sec of cancellations.

Inkjet printers are non-impact, electronically driven printers that use hundreds of tiny print head nozzles that each eject, by thermal pressure, a single drop of ink on a surface to form text or images. Technical research in ink drying and sharpness has given them high availability and reliability.

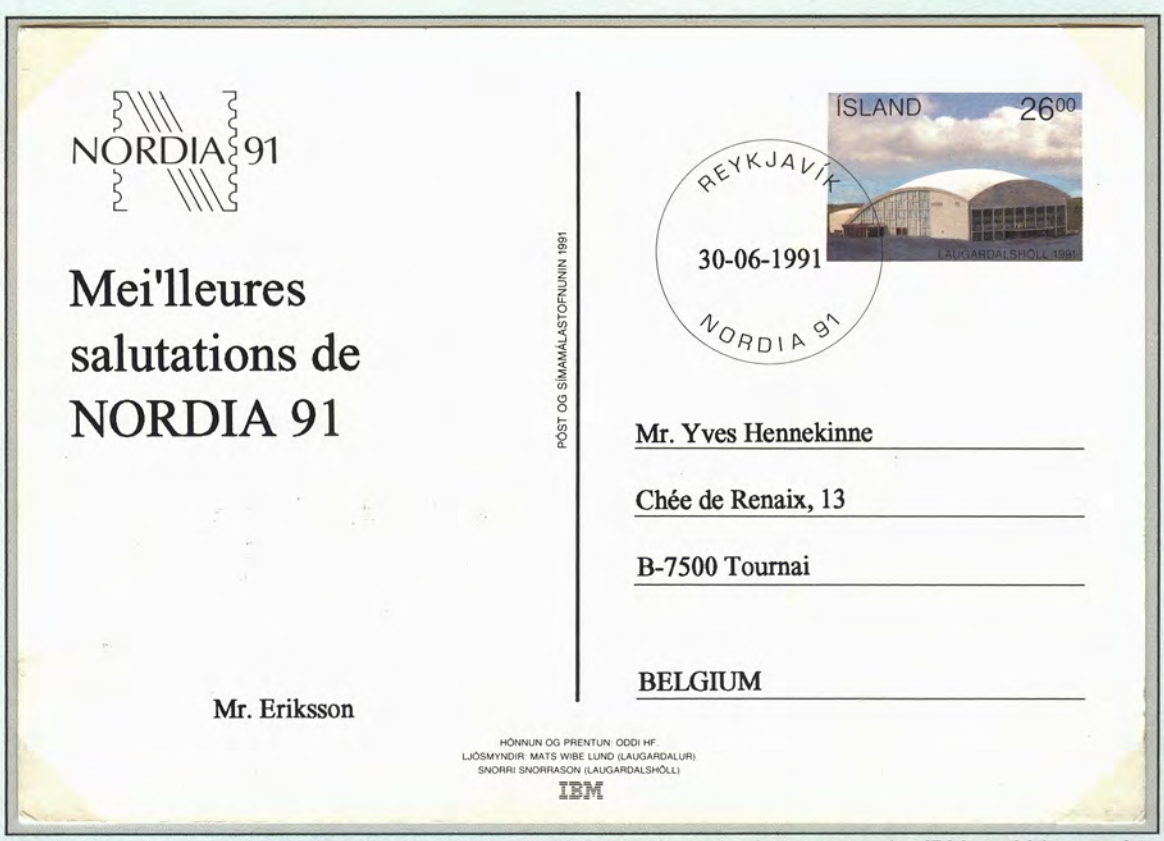
The numbers (every fifth stamp) on those coil stamps (Germany) were printed by an inkjet printer. Before those numbers were printed by traditional printers.

Plotter (detail)

A plotter is a device that uses one or more ink pens that can be raised, lowered and moved over the printing media to draw graphics or text. Combinations of horizontal and vertical movement are used to draw arbitrary lines and curves in a single action, in contrast to printers, which usually scan horizontally across the page.

In 1970 the Dutch Post administration designed stamps with very complex drawings and were fully drawn by a plotter driven by data stored on paper punch tape. This technique is to eliminate duplication, as the complexness discourages forgers.

A laser printer uses laser beams to produce an image or text on a rotating selenium imaging drum. The developer drum transfers toner from the toner bin to the charged areas of the imaging drum, which then transfers it onto the paper into which it is fused by heat. Toner is dry ink powder, generally a plastic heat-sensitive polymer.



*During the stamp exhibition **Nordia 91** a network of terminals and printers setup by IBM could be used to send the above stationary in an automated way. Date of mailing was printed by a central laser printer in the preprinted cancellation, together with an address and message chosen by the sender.*

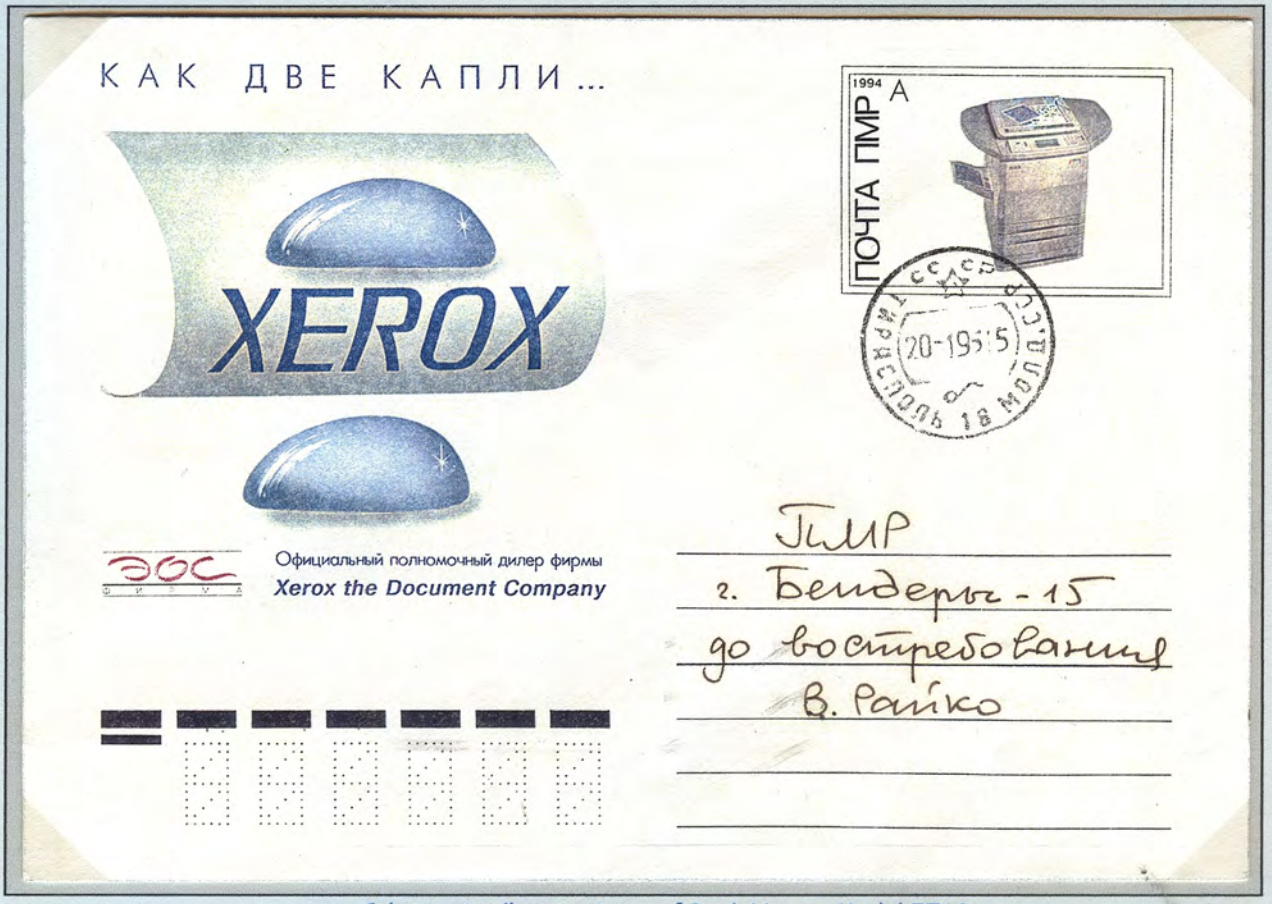
*Letter with 3 different colored stamps; 5c blue, 10c red and 40c yellow with Papal emblem in black, sent as **"PD"** (Postage paid to destination) from Rome (Papal States) on 10.01.1870 via Saint-Michel-de-Maurienne, France (see blue transfer cancel E.-PONT. St. MICHEL - 13JANV1870) arrived in Knowle, Great Britain on 14.01.1870.*

Represent the 4 basic colors of every printed image.

CMYK

Digital Printing

Today's laser and inkjet printers print in colors. Most of the entire spectrum or gamut of colors can be reproduced with just the four process ink colors (CMYK); Cyan (blue), Magenta (red), Yellow and black (K stand for *'key'*; traditional word for the black printing plate). Small dots of these colors are printed at different angles to create the printed image.



Color copier/laser printer of Rank Xerox; Model 5760

In the 1960s till 2000, the Xerox Corporation held a dominant position in the copier/laser printer market. In 1969 Xerox engineers developed a laser beam to "draw" an image directly onto the drum before printing it.

◄OCR font
flam cancellation ►

A tool for electronic identification and digital encoding of printed or handwritten characters by means of an optical scanner and specialized software is OCR (Optical Character Recognition).

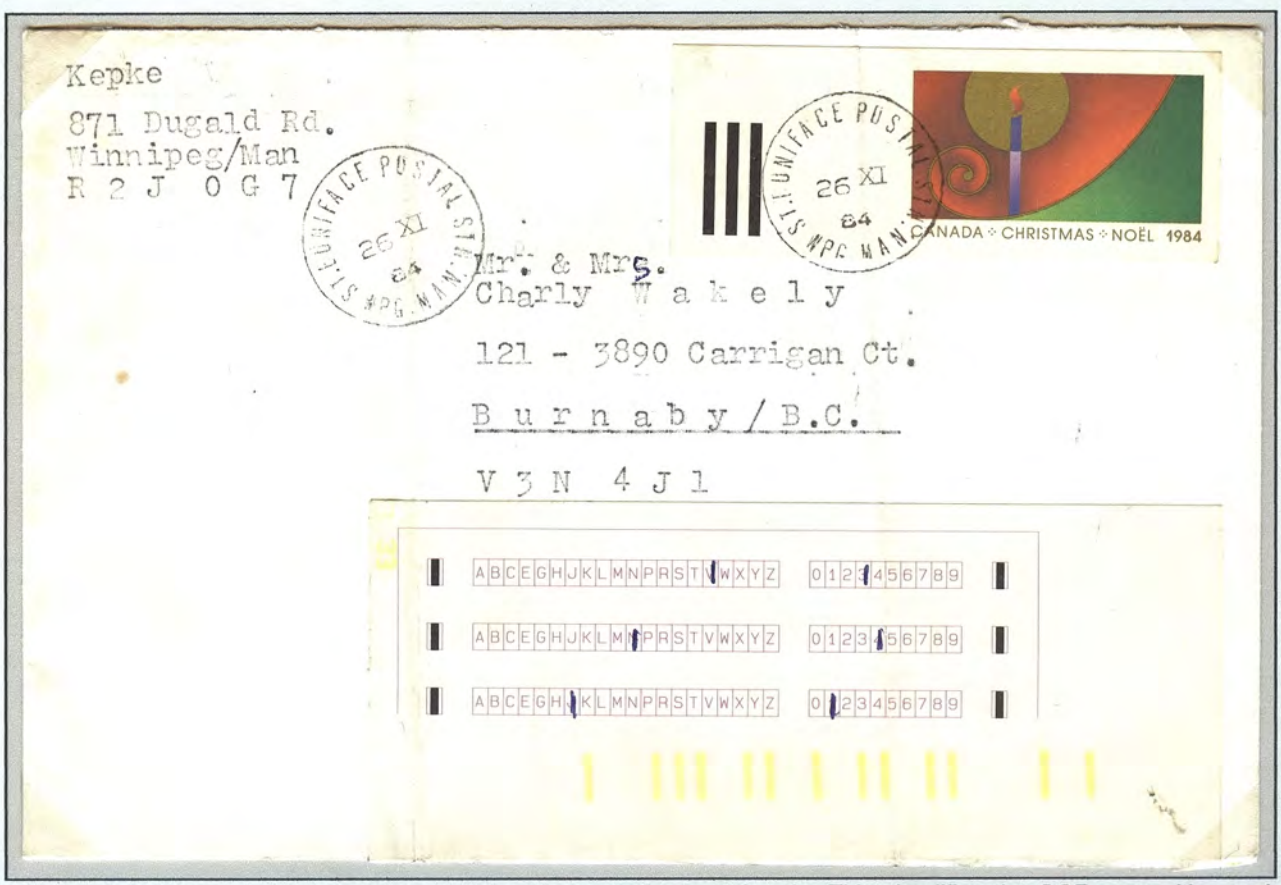
Magnetic Ink in combination with OCR

Shift colors

Special magnetic ink is used for printing banknote numbers in OCR character format (font). This way computers can check the banknotes for forgery and where and when used.

In the same way ticking boxes with a black pencil can help a computer optically to read or interpret data.

Optical ticking with a pencil



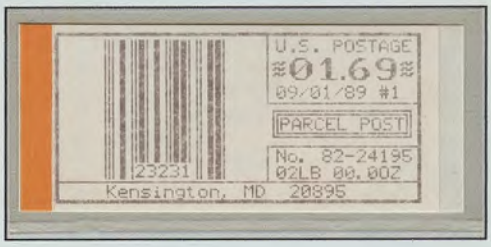
OCR sticker (Canada): allow senders to tick with a pen the postal code. This simplifies the OCR recognition and quicker sorting.

2.7 Coding with bars.

In 1952 Mr. N. Woodland and Mr. B. Silver received their patent for barcodes. In 1974 a modern price scanner was first used it in the U.S. food industry.

◄ *First stamp booklet with barcode (type UPC - A) issued by US Postal in 1987*

Type UPC-E used for the Autopost Experiment; a self-service stamp machine. The stamp was printed at the moment it was sold. It was tested in Washington DC and Kensington. After a lot of problems, like disappearing ink the experiment was stopped. ►

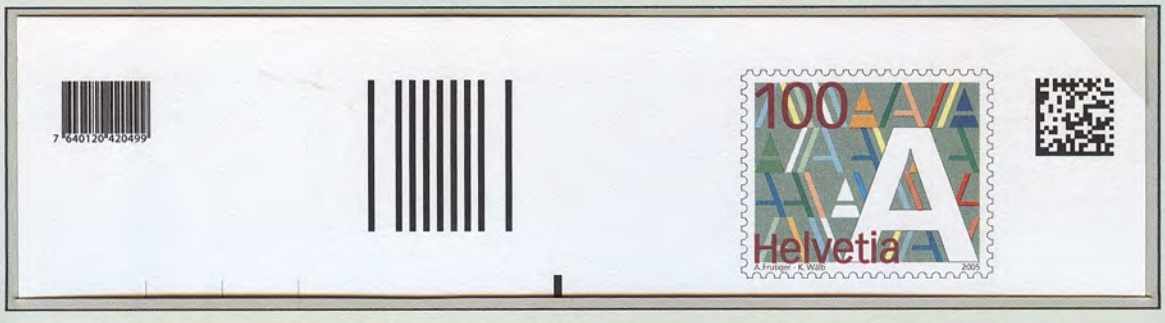


Today, all products sold are marked with a barcode called a Universal Product Code, or UPC.

Europe uses a derived version of the UPC called EAN-13 (European Article Number); an extra check-flag was added to it. The EAN replaced the UPC in the year 2005.

▲Barcode in border (type EAN-13)

Each code typically contains a printed horizontal strip of vertical bars of varying widths, groups of which represent decimal digits. Bar codes have a leading "quiet" zone, a start and data character, a check digit, stop character and a trailing quiet zone. Check digits are used to verify that the number has been scanned correctly.



Stationery (Switserland) with 3 types of bars; EAN-13 (left), 2-Dimensional CP-code (right) and sorting bar code (center)

Meanwhile 2 dimensional barcode are introduced to have access to more data. QR-code is specially designed for the automotive industry in Japan.

QR-code (Quick Response)

Meter stamp printed in dark blue instead of red for better automatization (Dresden, Germany Privatpost - Post Modern - 2012)

QR-code scan with smartphone

But QR-code is also very popular outside the automotive industry and now used in consumer advertising to allow smartphone application to route to internet information.

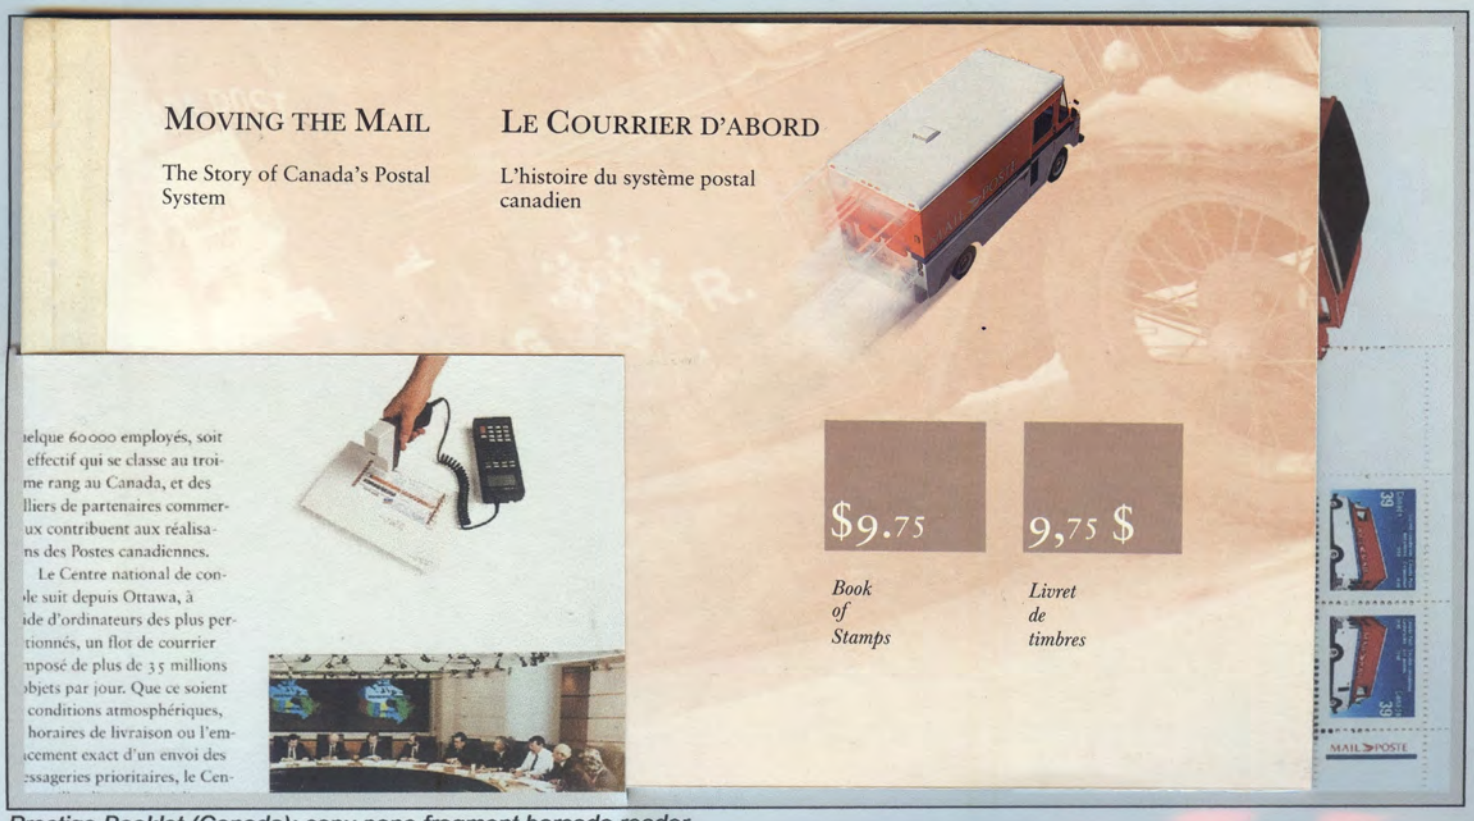
International Reply Coupon (Norway), barcode type CODE-128 used in every country by the treaty of world post signed in Seoul in 1994. A POSTNET barcode that consists of 62 bars with beginning and ending frame bars and 5 bars each for the letters of country code (NO) and digits of beginning and ending of validity, serial number and 074=IRC.

Large amounts of text (860 ASCII characters) and data can be stored securely and inexpensively when using the Data Matrix barcode, which is a very area efficient 2D (two dimensional), barcode using an unique perimeter pattern that helps the barcode scanner determine the cell locations. The cells are made up of square modules. Data Matrix barcode can encode letters, numbers, text and actual bytes of data; it can store and pass just about anything.

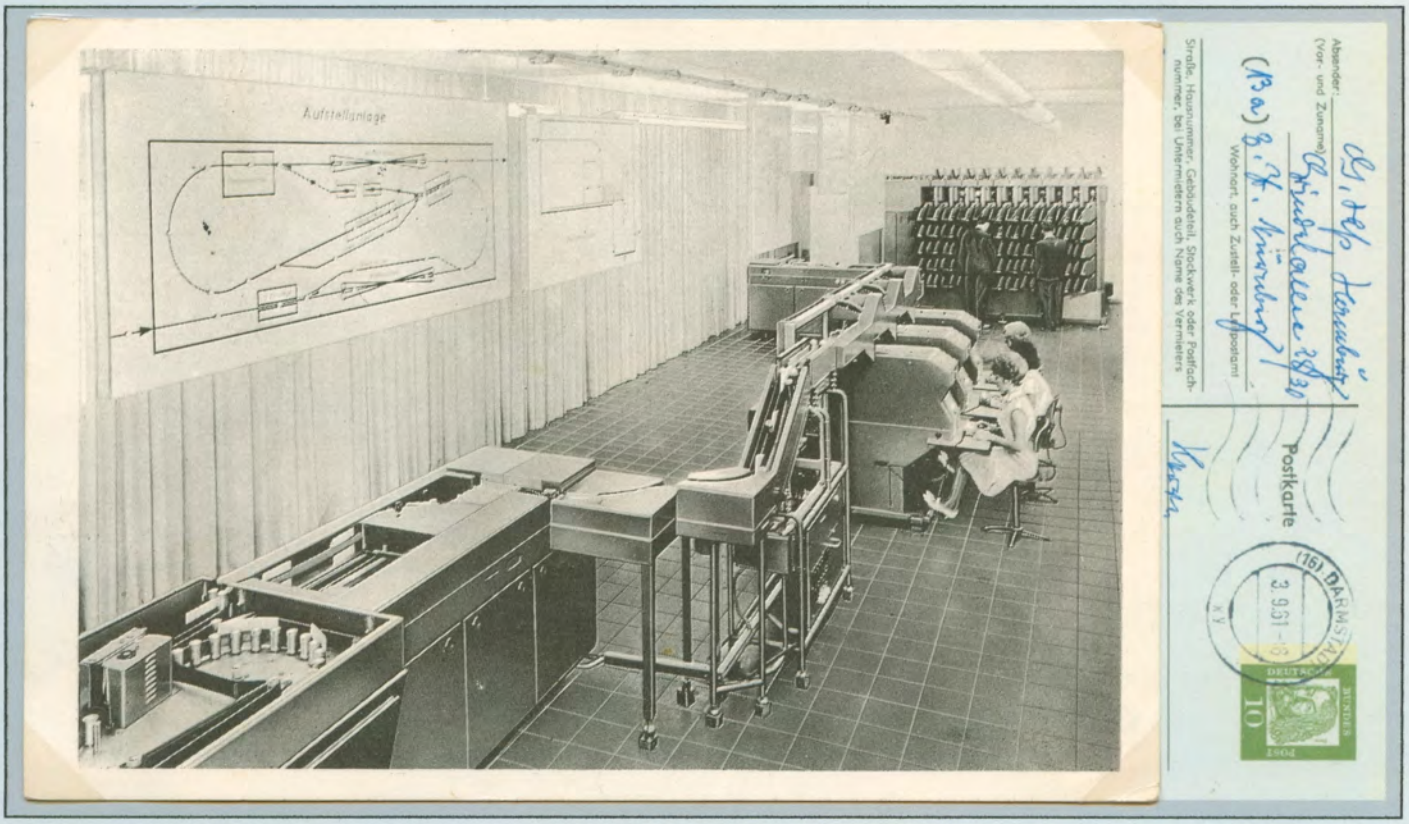
Mid October 2001 the Italian Post administration introduced a new self-adhesive label delivered by Tecnost (group Olivetti) containing a bi-dimensional barcode type Data Matrix. The Belgian post administration didn't have that technology, a barcode type CODE-128 was placed to send the registered mail smoothly.

◄ *vignette scan barcode registered (France); ill. barcode reader with red laser.*

Barcode readers usually use visible red light to read the code and interprets it either through software or a hardware decoder. When read it is send to the application for processing.

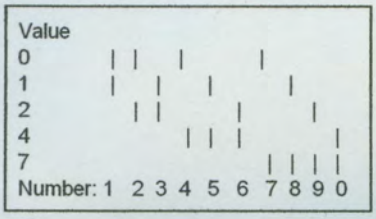


Prestige Booklet (Canada); copy pane fragment barcode reader.

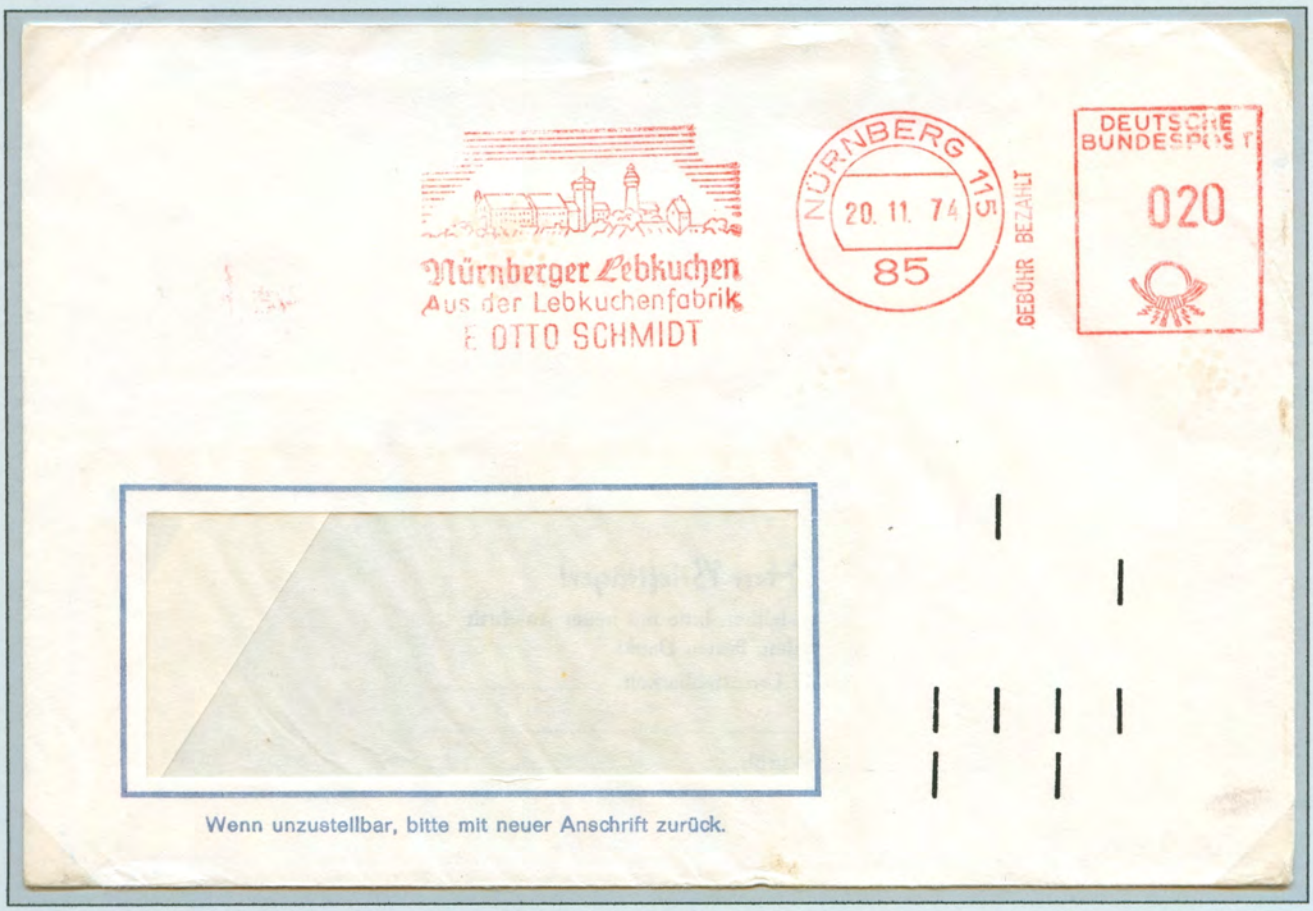


German postal letter sorting using the "Matrix Code II" came into general operation in 1965. The letters were provided for the preparation of the mechanical sorting with the coding set by the staff up to 5000 letters per hour.

Stationary issued for "Commissioning of the first automatic / letter-sorting of the German Post / Manufactured by the company Siemens & Halske", 31.05.1965 in Pforzheim illustrated with a stylized model of a spiral and a wrong Matrix Code II encoding avoiding mismatching with real coding.

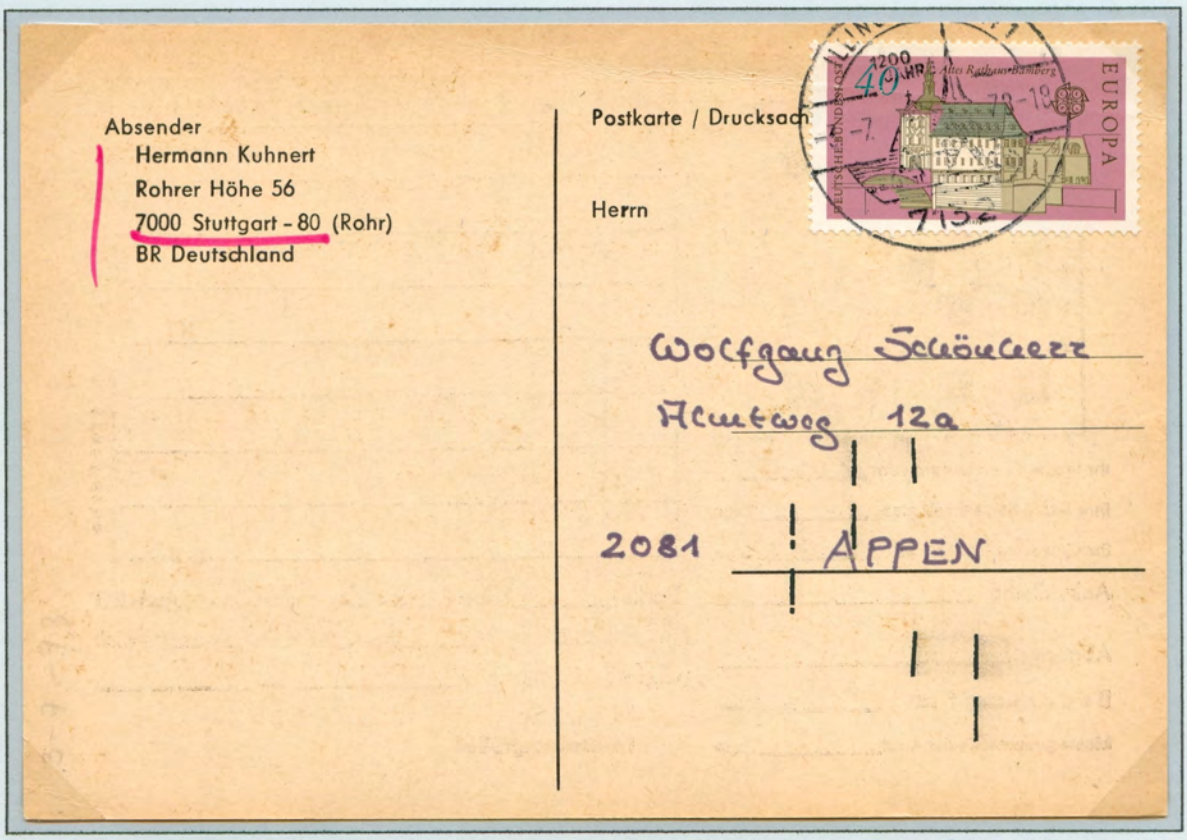


The code consists of lines in four columns (from left to right four digits of ZIP code) with 8 mm spacing of five lines (top to bottom), the values 0, 1, 2, 4 , 7 In each column , two lines must exist (more or less printing error) and it is the sum of the values. For example: 0 +1 = 1, 2 +4 = 6, 1 +7 = 8, etc. 4 +7 = 11 is regarded as zero.



Letter send from Nürnburg: code representing 0405 or 5040, which point to internal tray of the sorting machine.

The wet printed film was made of magnetizable or luminescent paint for automatic recognition, printing color (black, white) bars as a barcode on the address field of the letter. The barcode inkt was secured by a 160°C heat.

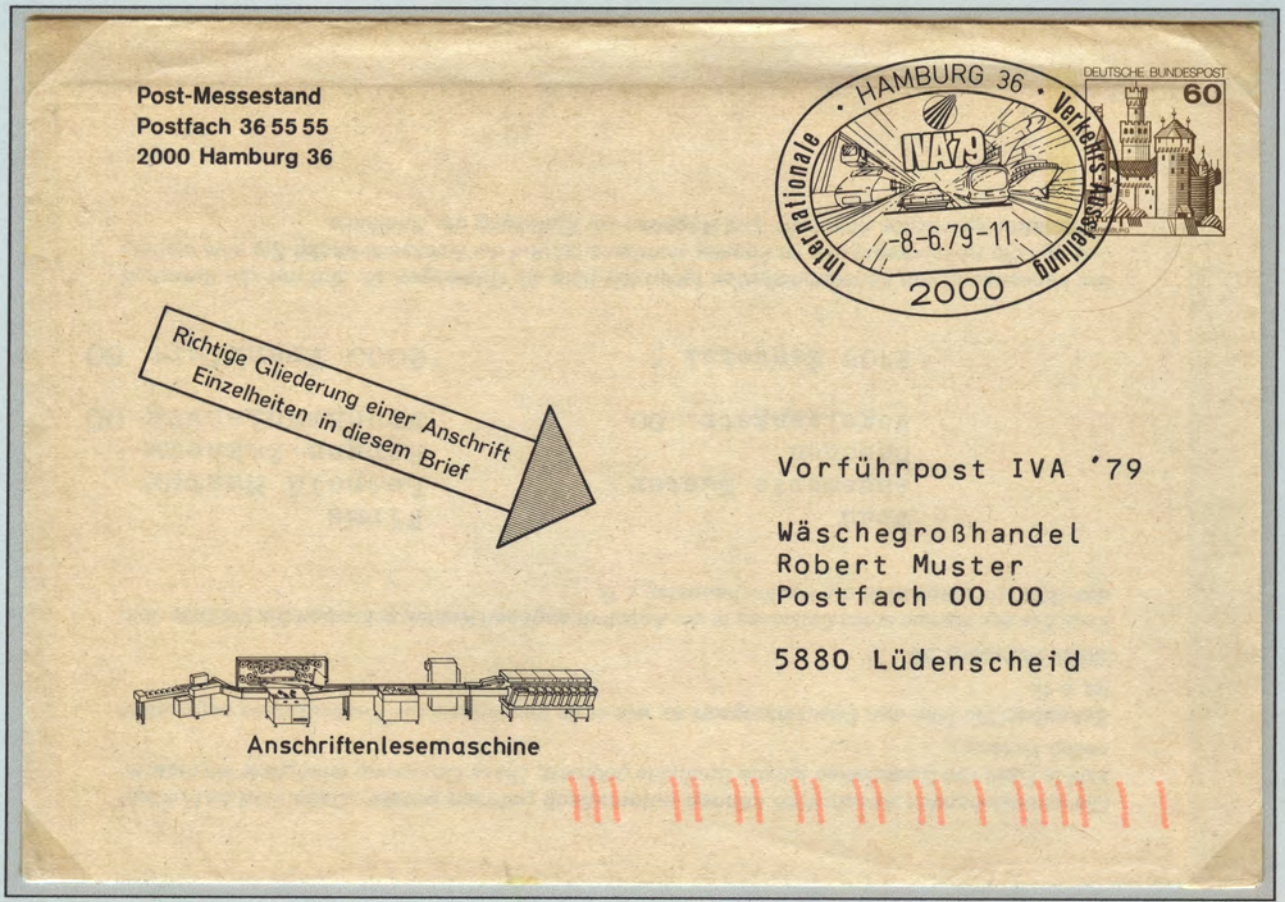


Letter send from Stuttgart: code representing 3140, which point to internal tray of the sorting machine.

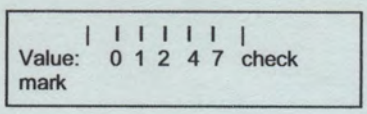
Often the matrix code on the lettre represented internal trays of corresponding city parts or even streets.

Letter from Stockholm to Älvängen (Sweden): bar code printed in white representing 5-digit 44600, small 0 next to code represents de code place.

Other countries like Sweden took over de same techniques. Also in Germany codes were printed in white sometimes.

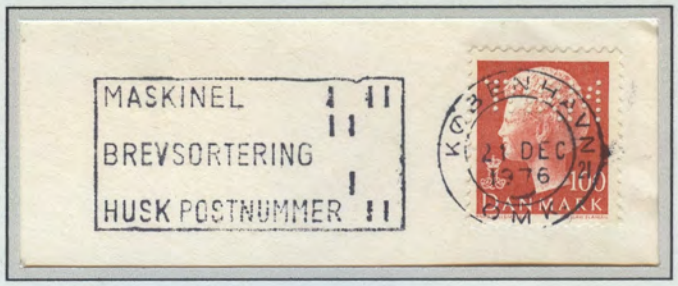


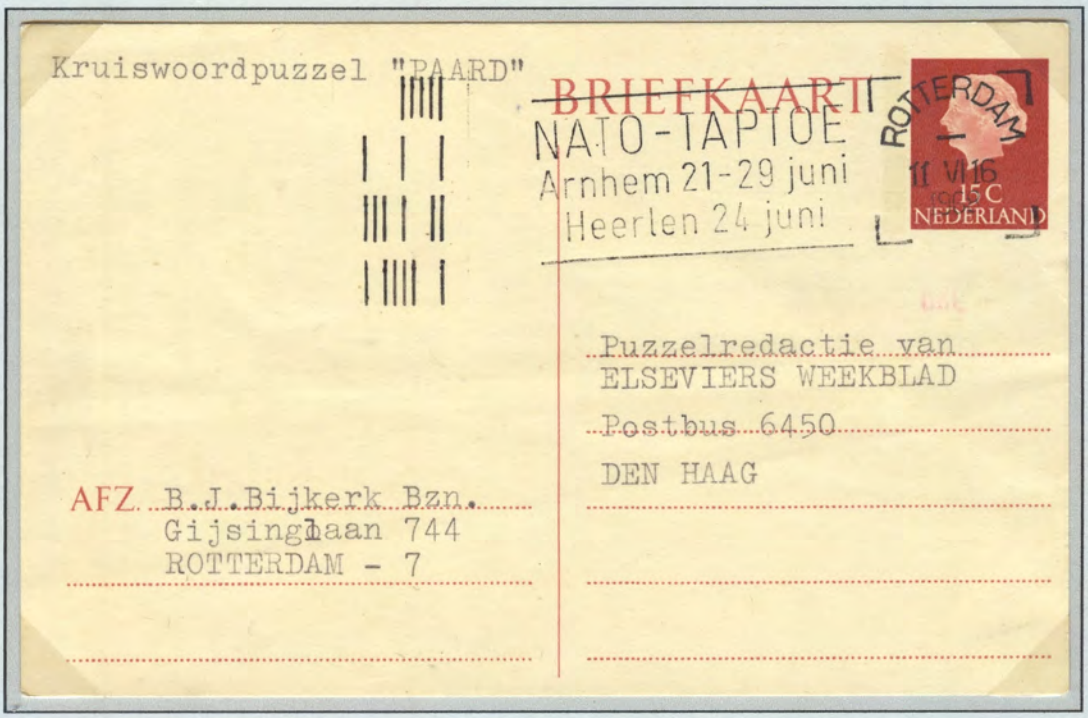
Printed to order (Germany) from Hamburg to Lüdenscheid: code representing 0885 9, left to right code reading. Value 9 points to internal tray or city area. Code gaps represent the value eg: IIIxx = 4+7 =0 ; IxIIx = 7+1 =8



From 1976 the "linear screening" was introduced, and first printed by mechanical printing units of ribbons, later with inkjet printers were applied. There are about a dozen linear code formats.

First-generation machines read the city/ZIP Code of typed addresses to sort letters. Mechanization increased productivity. By the mid-1970s, more efficient methods and equipment were needed if a postal service was to offset rising costs associated with growing mail volume. By end 1970s development of better OCR and expanded ZIP Code was introduced to reduce the number of manual mail piece handlings.





◄ *Barcode (Netherlands - 1968); from 1961 till 1981 a barcode next to the main cancellation was used for mail from Rotterdam to 64 main cities. There are 4 code blocks; lowest 2 code blocks contain the city, the uppermost 2 code blocks contain the code machine. The coding in the code blocks changed a few times in all those years. From 1977 the city code expanded so that the Netherlands could be completely served. In May 1981 the system was stopped and replaced by CMC-7 coding systems.*

2 stamps and a stationary with integrated barcodes (Switzerland); issued on 19 January 1993, to improve the mechanical sorting of letters. The barcodes are constructed with 16 to 34 colored bars over 2 cm on the right side of the stamp. The barcode reader BML4/BR, delivered by Schrack Aerospace of Vienna, recognizes the 60 Rappen (B-post) stamp on its 16 bars/2 cm and the 80 Rappen (A-post) on its 18 bars/2 cm.

Test letter used in the CFC (culler-facer-canceller) installed in Tours Centre de Tri in the period October 1982. Fuzzy cancellation caused by multiple use of the training post. Cancel of first generation with Toshiba logo. Number 850: 8 stand for country France, 50 represents type of envelope and paper used. Stamps pre-printed vertical for testing this type of sorting machines.

In 1973 the company Toshiba (**TO**kyo **SHIBA**uda limited - Japan) delivered sorting devices to the French post administration; 77 installation as a start. In 1991 all sorting centres were equipped and were able to sort 25.000 items per hour.

Test mail from the company TOSHIBA, passed in Rennes Centre de Tri for testing purposes. Number 813: 8 stand for country France, 13 represents type of envelope and paper used. For simulating real mail sorting, all kind of sizes, colours, and different paper quality was tested. Stamps are specially pre-cancelled with phosphorescent bar for use in this type of sorting machine. This enables that the letter is always presented in the same disposition. Stamps pre-printed vertical for testing this type of sorting machines.

2.7 Coding with bars.

The barcode (type CMC7) at the bottom of a letter is generated and printed automatically and is a translation of the postcode on the letter.

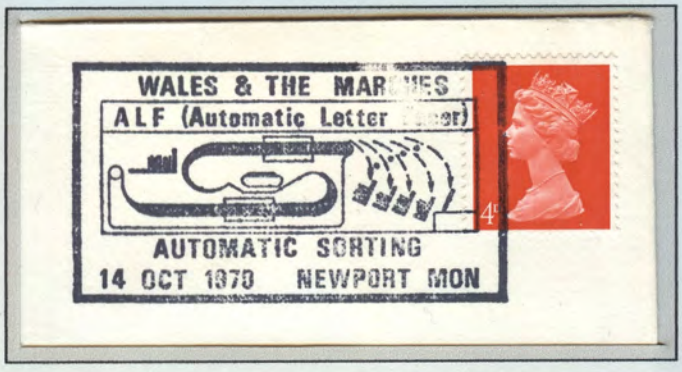
Small grey circular or diamond shaped spots on Machin (Great Britain); Mail-test markings that are applied to the faces of envelopes in tracking mail pieces during a mail test. Some of them happened to fall on the stamps affixed.

In most of the cases handwritten or printed zip codes can be read automatically by sophisticated OCR-software available in powerful sorting systems. An operator will handle zip codes that couldn't be validated. But sometimes it can go wrong…

*The zip code on the letter was misinterpreted by the OCR-system of the sorting machine and translated into a wrong bar code. Due to that the letter was sent to the wrong destination (St. Sauveur en Puisaye). The letter was sent to the correct city after marking it with the postmarks **FD** (Fausse Direction). It was canceled again by the receiving post office and the bar code was canceled*

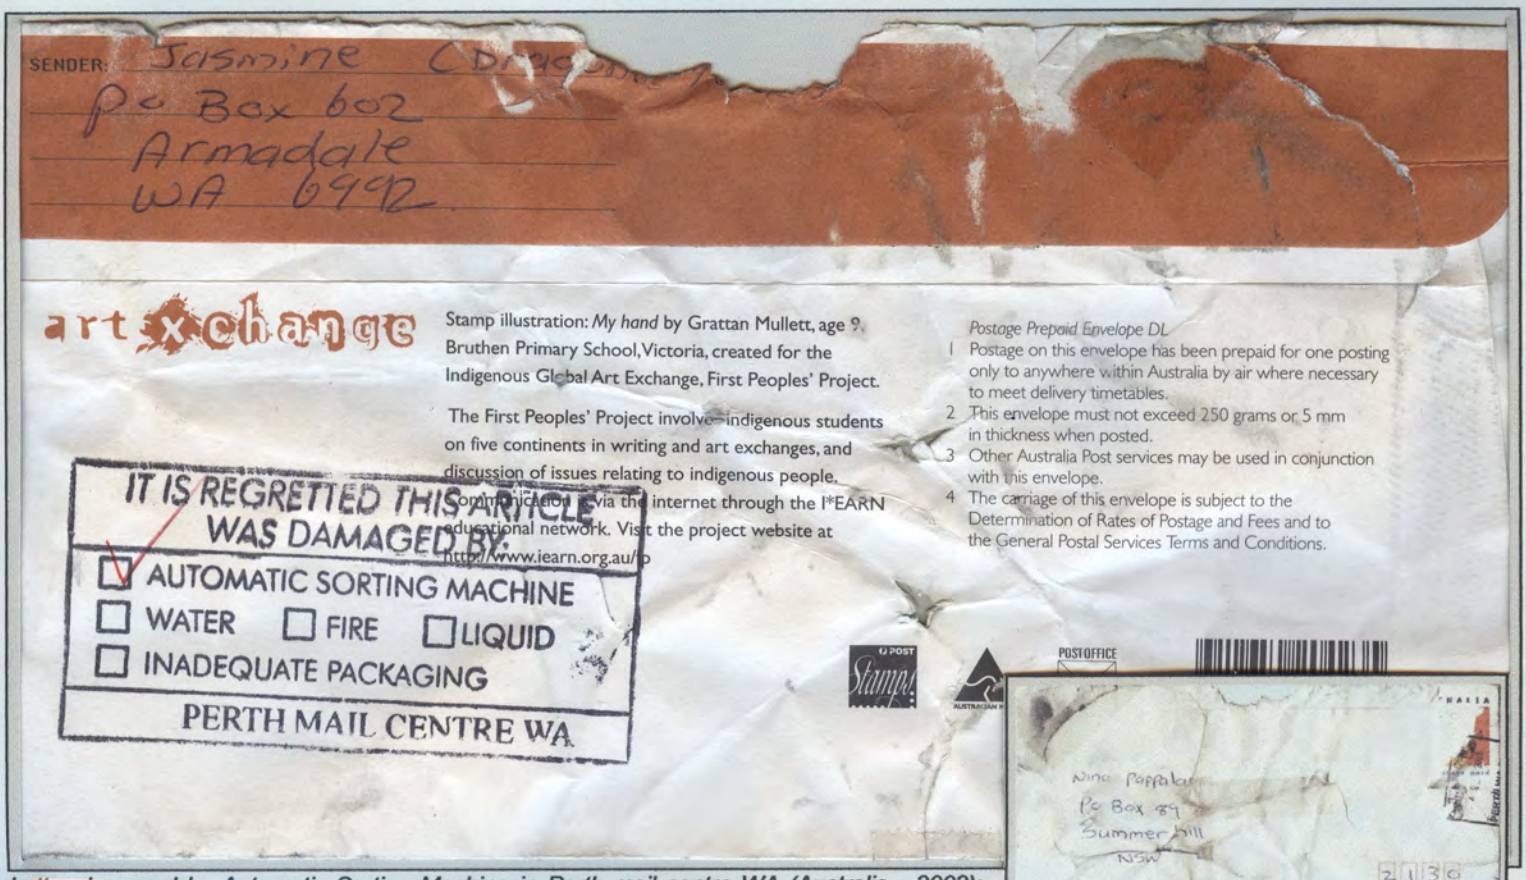
2.7 Coding with bars.

Once a letter has a corresponding bar code, the letter is transported to the sorting machine, where it can be sorted very quickly by that bar code.



Nowadays 39.000 letters per hour at peak can be sorted and canceled. To drop a letter into the right bin it need OCR software and mechanical transporting process supervised with lots of electronics.

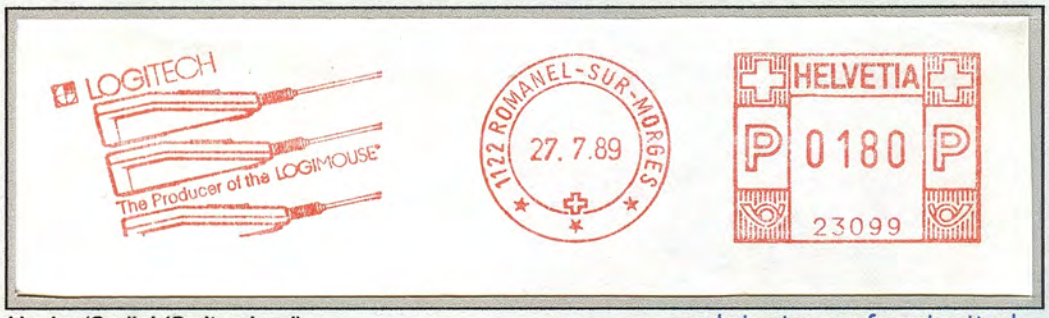
But a letter can get stuck, and jams and stops the whole chain.



Letter damaged by Automatic Sorting Machine in Perth mail centre WA (Australia - 2002); returned with apologies.

2.8 Point, touch or read your input.

use the mouse, pen or finger



Hasler 'Smile' (Switserland)

early Logimouse from Logitech

Overprint (Rumania) 300L on 90L dark green PC mouse symbol.

The best-known input device after the traditional keyboard is the "pointing device" - "mouse" in computer slang. It creates input by clicking selections on the screen. The motion of the pointer on a display can be any symbol like an arrow or a hand.

Early used 'Sloper arrow' cancel, Liverpool 1871.02.04 (Great Britain); used to speedup cancelation to cover massive sending of very popular card.

hidden rolling ball

Light pen

The first pointing devices had a hidden rolling ball on the bottom side of the mouse, later technology detects the two-dimensional motion by infra-red light.

A *light pen* is a light-sensitive stick used in conjunction with a screen and allows to point to displayed objects or to draw with greater positional accuracy. Same with a *touchscreen* containing invisible internal circuits that reacts when touching with a finger or pointing stick. This way the position is known and the chosen item or selection can be processed.

Today each computer is equipped with a screen. Request and answer can instantaneously be seen. This is called data communication. Such equipment is called a **'terminal'**. In the very beginning everything was printed out on a printer or punch tape or punch card.

After the successful use of the terminal in the Apollo space project in the sixties, by showing results via the cathode tube about measurements of the Saturn-V rocket, it became a common tool for real-time processing.

Radiogram via RCA (USA)

The RCA110A computer was an important phase in telemetry and real-time data display.

RCA (Radio Corporation of America) and GE (General Electric) built two computers, GE225 and GE235, to combine their telemetry knowledge and to display all measured data at NASA. Later other control centers did the same.

Inventions such as a musical box, barrel organ or automated and animated mechanized metal figures are the first machine programming events. Punched medium is the most used media in the beginning.

Fürther Kirchweihleben.

Af d'Färtha Kärwa, na,
Dou freut si grouß und kla;
Es ko nix schön'res geb'n
Als so a Kärwaleb'n.
Ja scho am Sonntog fei
Dou fahr'n nach Färth glei rei
Ganz haftenweis die Leut,
Weil dös is halt ka Freud!
Am Plärrer af der Boh
Kommt grad as Dampfroß oh,
Dou sterz'n si die Leut
Af d'Wög'n hie, wie net g'scheid.
Die allergrößte Naß
B'setzt glei die erschte Klaß,
Der Kondukteur schreit:
„Nrraus!"
Den lacheus ner blouß aus.
Und kommas dann nach Färth,
Geht's hi zon Miß'n-Werth,
Zon Kütt, Nett, National,
Und afn freia Ball.
Und wer im Wertshaus hout
A Broutwurscht und a Kraut
Der dörf zufried'n sa
Und sen's a no so kla.
Gar mancher, der recht karg,
Der ärgert sich auch arg;
Denn d'Krölgwern gfüllt da af,
Daß fehlt a Schoppen draf.
Der Harfenisten Zahl
Bringt „Leben" ins Lokal;
Sie geb'n si alle Möih,
Is d'Stimm a oft net schöi.
Sie spielu den „Hampelmoh",
„Die kleine Frau", so, so!
D'Leut stimma glei mit ei
Recht kräfti zum Refrai.
Wenn's Singa geht so schöi,
Macht's Trinken a ka Möih
Und Ansichtskarten fei
Wern g'schriebu a Dutzed glei.
Der Kellner schimpft und brummt,
Weil jetzt der „Bayer" kummt,
Singt der sei Leib-Couplet
Im Gang bleibt alles steh.
Und schreit der Kelluer: Soos!'
Dann geht's Gewärg erschtlos.
Mer schöibt si hin und her,
As Umfall'n des göiht schwer.
Jetz göihts vor af die Meß,
Dou machens erscht ihr Späß.
Mer schaut die Bud'n oh,
Kaft Plätzli und Bonbo!
A jed's freut si scho draf,
Af'n Kinematograf.
Mer gafft beim „Kasperl" dort
Und laft beim „Sammelu" fort.
Vom Fotografenmoh
Läßt mer si schmui'n oh,
As Schöiß'n wird probiert,
Die Damen dort poussiert.
Nou steig'ns af's Karouffel,
Sie sen scho nimmer hell;
Und steig'ns vo dort dann ro,
Nou draht si's aber scho.
Am Rathaus langt mer glei
Töif in Glückshof'n nei
Und zöigt mer a nix raus
Da macht mer si nix d'raus.
Beim Hermann hint'n singt
Die Gusti, daß es klingt
Und sammelt fleißi ei,
Ja dös verstöihts gar fei.
Zum Kneipwert abends dann
Geht schwerbeladen man;
Mer thout politisier'n
Und fest a kritisier'n,
Daß m'r d'Kärwa will verleg'n!
Dös ko ka Mensch versteh'n.
Die Kärwa, dös is klar,
Mouß bleib'n wöis bisher war,
Nou schwelgt a jedes Herz
In Frohsinn und in Scherz.
Zlezt is mei Wunsch no der:
„Kummts fleißi alle her
Ihr Gäste, lölb und wert,
Af Kärwa rei nach Färth."

Verlag von A. Schmittner, Fürth.

◄ *Specimen*

Von Kempelen

Already very early men always tried to build automates that have its own capabilities of thinking and in function of working for mankind.

In 1769 a chess playing automaton known as 'The Turk', was invented by the Hungarian baron **Wolfgang von Kempelen**. It was in fact a trick. The automaton was big enough to hide somebody small inside who operated it.

Karel Capek

Torres Y Quevedo, known for his chess endgame automaton, introduced cybernetics. A mechanical contraption realized in 1912 as a clever accomplishment in classical mechanics.

In 1921, the Czech author **Karel Capek** produced his best-known work, the play *R.U.R. (Rossum's Universal Robots),* which featured machines (ROBOTs) created to simulate human beings.

The Czech word "robota" refers still today to work that's boring or uninteresting and someone is obliged to do and not voluntarily or for fun.

Torres Y Quevedo

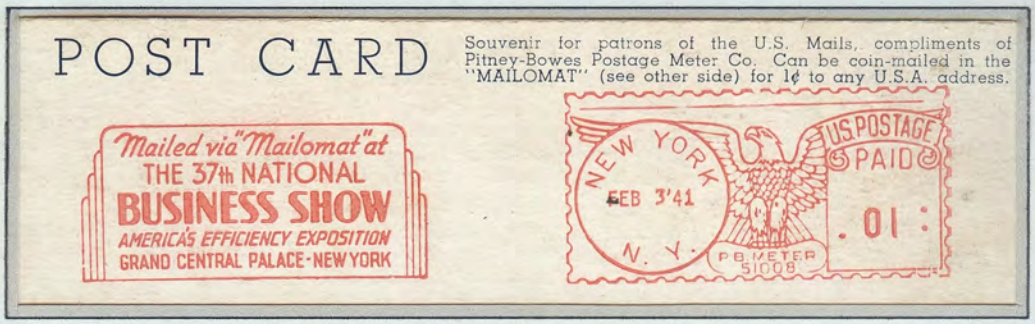
chess automaton

Specimen meterstamp model Neopost with prefix N (Great Britain) - text: Automatics

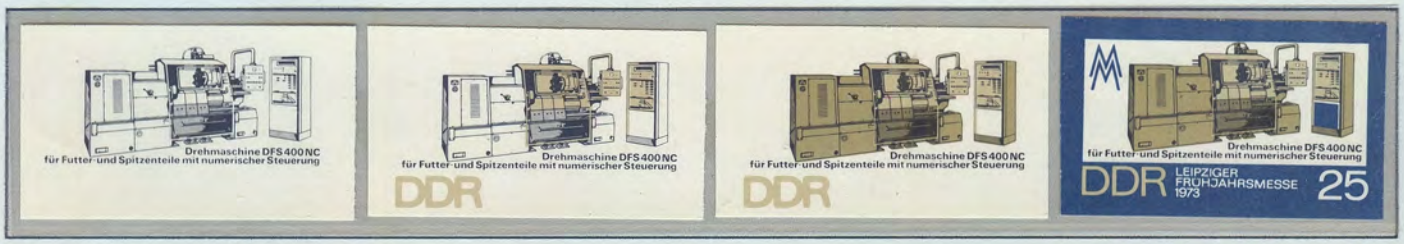
A jukebox is a nice example of a robot.

Publibel (Belgium)
Robot AMI Jukebox

Automates perform in a fast and continuously way, tasks that need a lot of concentration or are too repetitive for humans. and also time and energy consuming.



Pitney Bowes "Mailomat" (USA -1941 - B 51000 series); self-service automates; 72 letters/min



Progression proofs (East-Germany)

numeric steering lathe machine

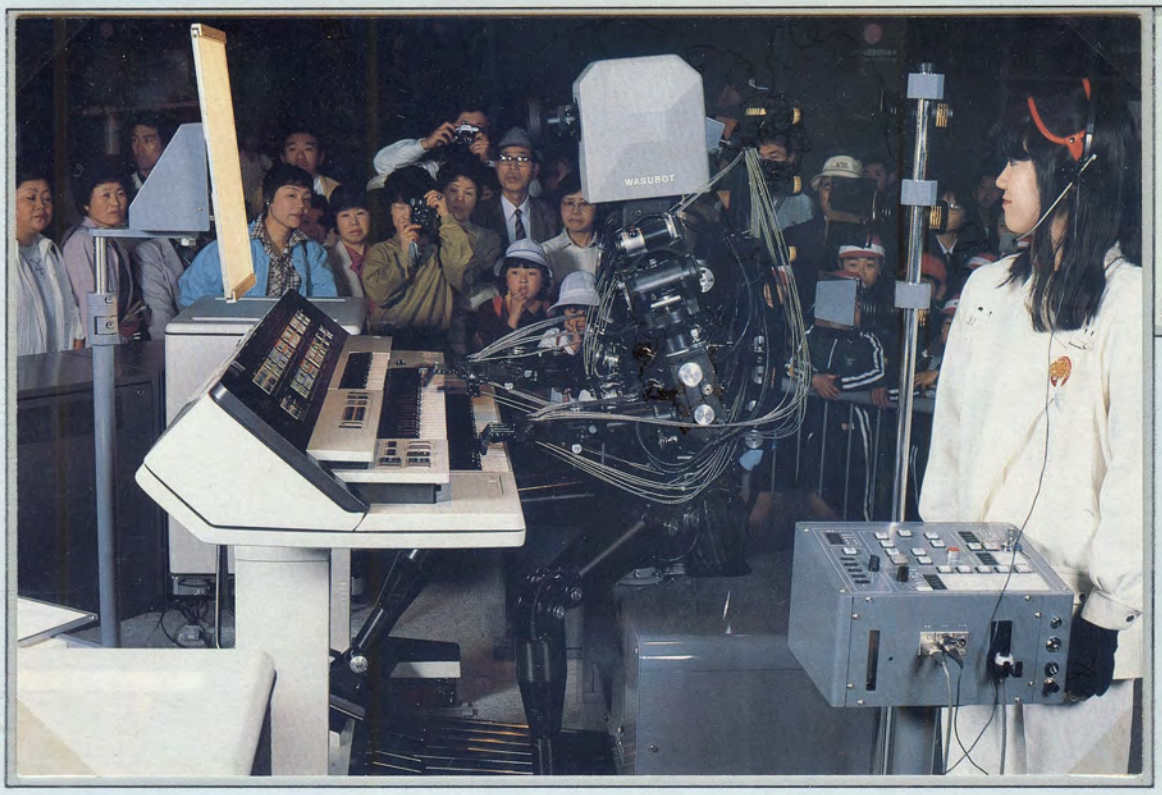
Automates or robots perform mathematical operations on continuous measurements, such as temperature, pressure, time, etc..., and are controlled by instruction sets on punch tape, punch cards, or ICs or connected to a computer.

Robots are mechanical or virtual artificial agents, usually electromechanical machines that are guided by computer programs stored on ICs or chips or electronic circuitry.

Programmable Chip

Real robots are not yet a fact! From the very beginning men have been trying to replicate parts of the human body and mind. But since the invention and miniaturization of the computer, many attempts have been taken place with partial successes.

The ICs or chips are developed and designed with computers and produced with fully integrated automates or robots with high efficiency and perfect results. Conclusion: robots are making robots.



Regional stationery (Japan)

Wabot-2 active at Tokyo Expo 85

Japan and South-Korea are far ahead in developing robot technology. In 1980 laboratories of the Waseda University started the WABOT-2 project. This is an anthropomorphic intelligent robot WABOT (WAseda roBOT) playing a keyboard instrument and was set up as an intelligent task that the WABOT-2 aimed to accomplish. The robot was shown on the Tokyo Expo in 1985.

Write the message very plainly below this line.

Sender's Name & Address "THE AERO FIELD" SUTTON COLDFIELD, ENGLAND

To Commemorate
The Last Airgraph Despatch, July, 1945

Prussian aggression has been directly responsible for the introduction, by its victims, of many novel methods of conveying messages, such as the Balloon and Pigeon Posts of Paris in 1870-71. With the Airgraph service, special forms are provided measuring 11" by 8". The letter sheet is then photographed on a film negative measuring ½" by ⅝" On arrival at the destination the negatives are passed through a continuous enlarger which produces a photograph measuring 5" by 4". These are dried on a wheel at the rate of 40 letters a minute, after which the copies are folded and placed in a special window envelope which bears the word "Airgraph" like illustrations above.

A Page from the "H. Crabtree" Collection

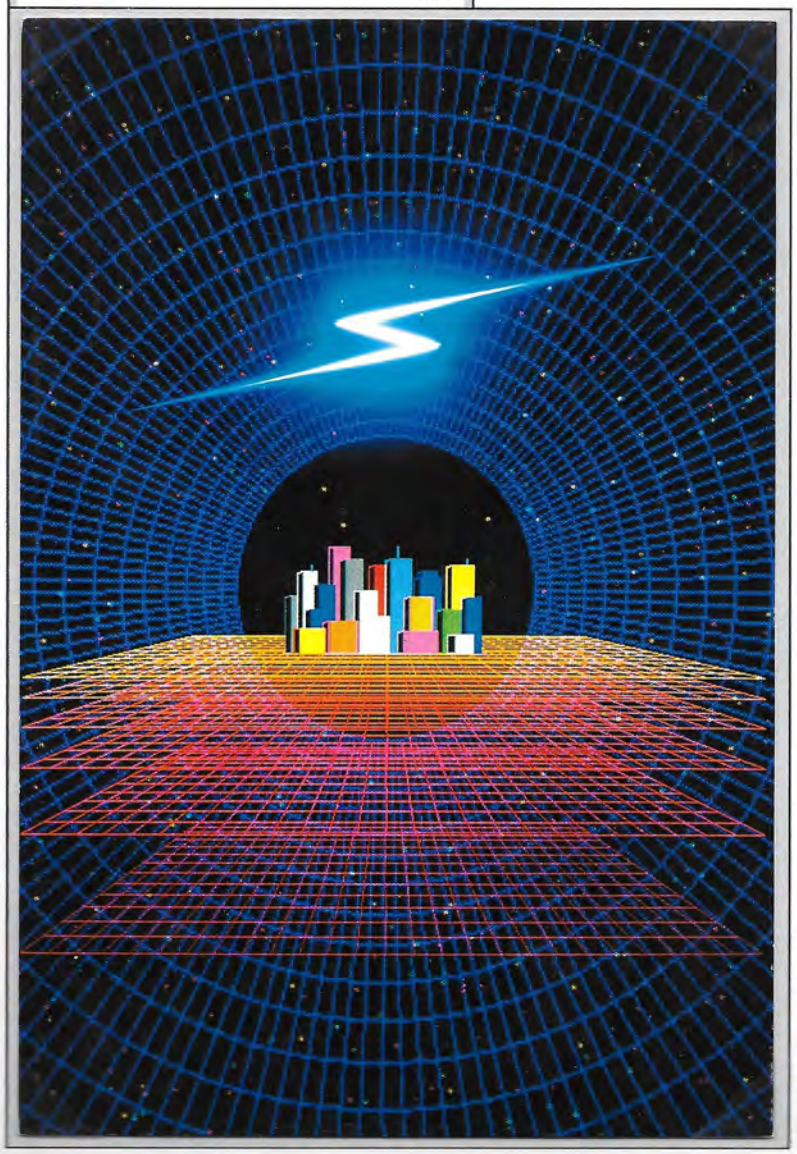
Users need all kinds of tools (statistics, analytical and graphical) ready to reply on various business questions and preferably with quick response times.

'Kinderpostzegels' (Netherlands); look-a-like early version paint software of Windows

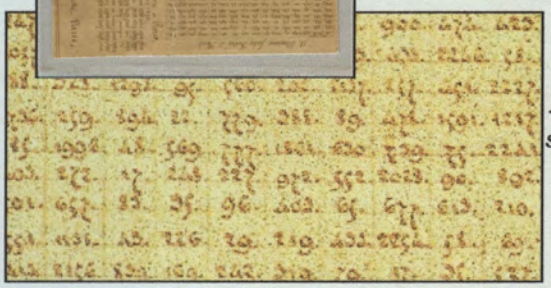
The graphical capabilities of a computer we learned to know in drawing tools such as Paint or Photoshop programs. Graphic design tools are very useful for visual communication and effects, as well in problem-solving research and developments. Julia set fractal visualization is for example very much used in chaos theory and generation of various models.



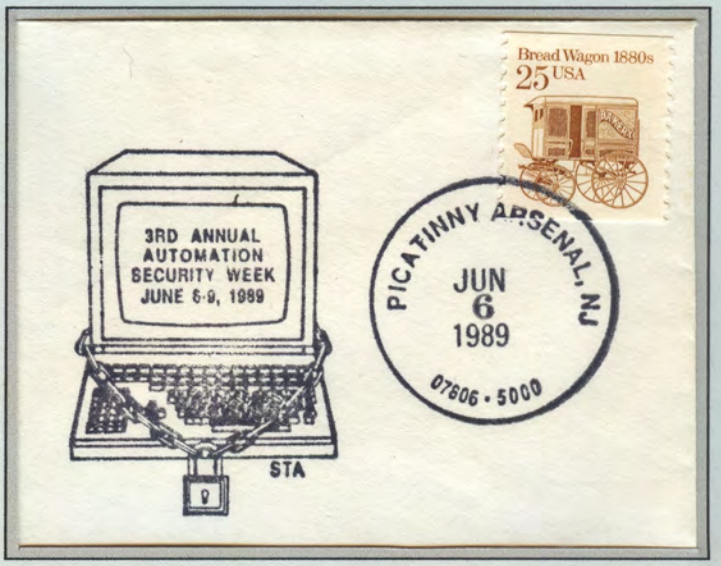
The commercial industry and the film industry deliver spectacular generated images. 'Toy Story' is the very first full length film where all characters and environments are completely developed by computers. Only a few manual interventions were needed, like mud on a car, spot on a wall, scratches on the parquet floor, etc.

Computer security and protection of information became one of the hottest issues the last years.

◀ *Pigeongramme on photo paper: governmental flight done by Steenackers on 19 Oct 1870 to Jules Favre, French vice-president and minister of foreign affairs.*



◀ *Detail of pigeongramme: showing coded messages*



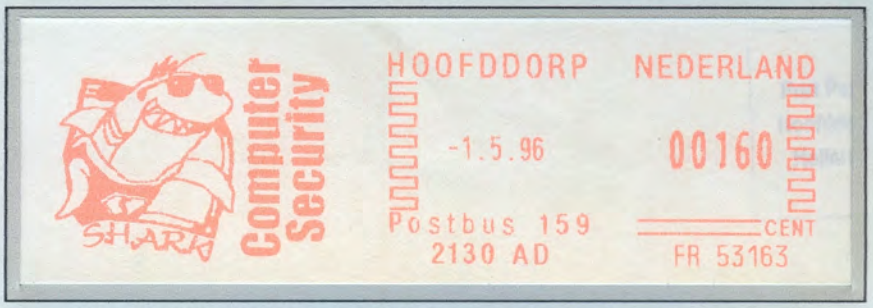
Already during the Franco-Prussian war in 1870 and the Siege of Paris coding governmental messages was introduced to protect the French pigeon post communication when pigeon felt in Prussian hands.

Also the Germans introduced network security during World War II. To protect their communications they used the Enigma, which was a machine capable to secure sending and receiving message, by using a primitive form of encryption.

US 6813th Signal Security Detachment APO 527 war cover sent from Bletchley Park: their task was more related to traffic analysis and cryptanalysis of their sources in the field like Enigma, Morse and radio messages. Sgt. Earl W. Swanson was hosted in Hut Six in the log reading section dealing with all incoming messages.

British mathematicians, like Turing, and with the help of Polish resistance, French and Americans were able to break the code rapidly. This makes encryption one of the weakest links in a fully secured chain.

Fingerprint protection



Francoptyp-Postalia "T1000" digital (Netherlands) - text: computer security

During the past years computer users throughout the world have fallen victim to a series of attacks (like sharks); hit by viruses or spoof mails, flooding computer systems with incoming messages, destroy systems or grab passwords. Therefore computer systems and Internet are since a long time protected by passwords, or since recently replaced with fingerprint protection or encryption of data.

Booklet (France): 6 of 20 stamps Marianne de Béquet 80c: partial printer quality. Text : "Mot de passe"= password

Internet represents an insecure channel for exchanging information therefor Internet security is most wanted and checking transferred data will ensure the integrity.

Letter sent as "PD" from Christiania, Norway on 04.04.1874 to St-Brieue, France and arrived on 09.07.1874. 4 different values: 1 sk (green), 2 sk (blue), 4 sk (brown) en 8 sk (red); representing of the algorithm of Hamming code the bit positions that are a power of 2; 2^0=1, 2^1=2, 2^2=4 and 2^3=8.

One of the most used algorithms is the algorithm of Hamming code. It is simply the use of extra parity bits to allow the identification of an error and even repair it. The bit positions that are a power of 2 are marked as parity bits (1, 2, 4, 8, etc). Each data bit is included in a unique set of parity bits, as determined its bit position in binary form.

Pitney Bowes-GB "6600" (Sweden): text: secure internet solutions

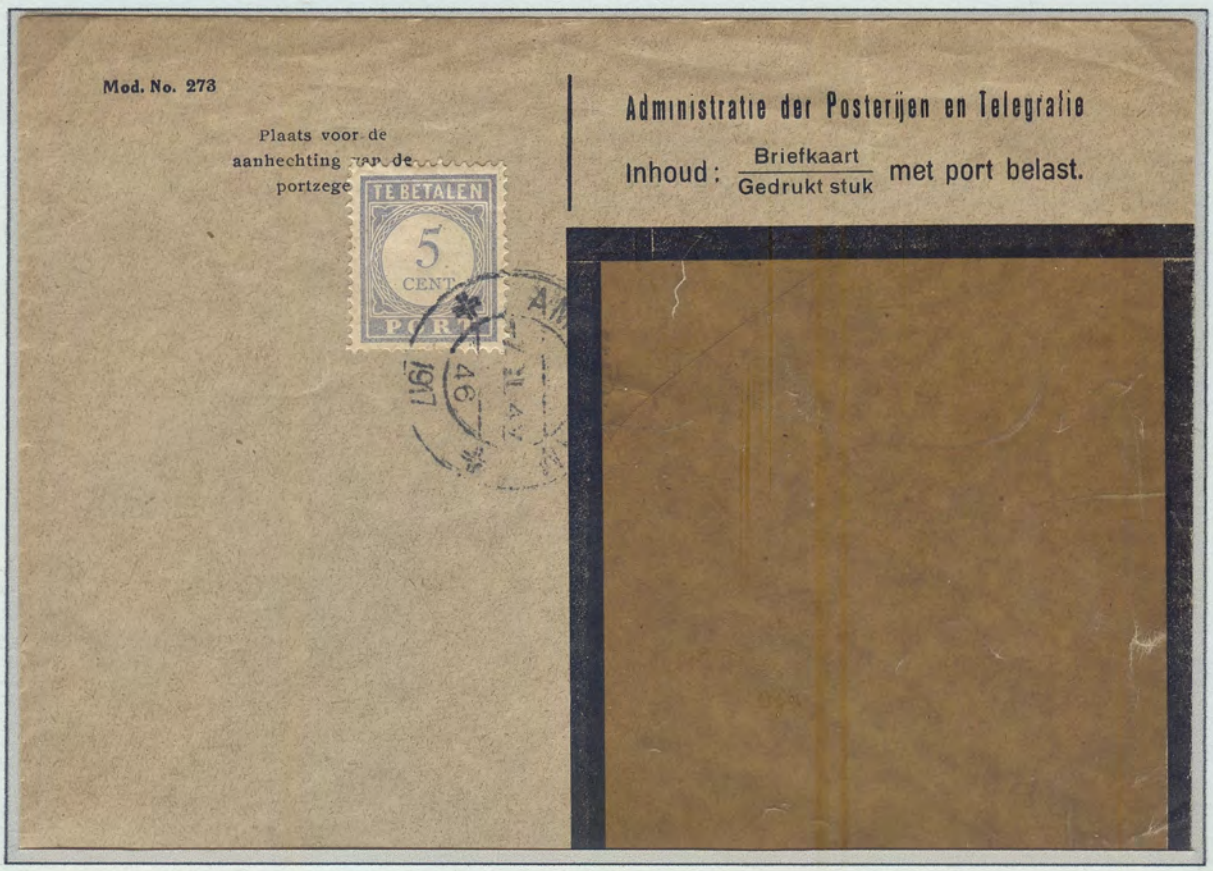
Computer and internet security is implemented in various ways already since the very beginning. Effective cyber defenses ideally prevent an incident from taking place by proactive approach.

Cyber defense ▶

'no' to copying

Text: Data Protection Agency

Data needs more protection, regulations installed against copying and distributing software. The Data Protection Act (DPA), now replaced by GDPR, is a law passed first by the British government and later European Commission, that sets out rules for those who use or store data about living people and gives rights to those people whose data has been collected.

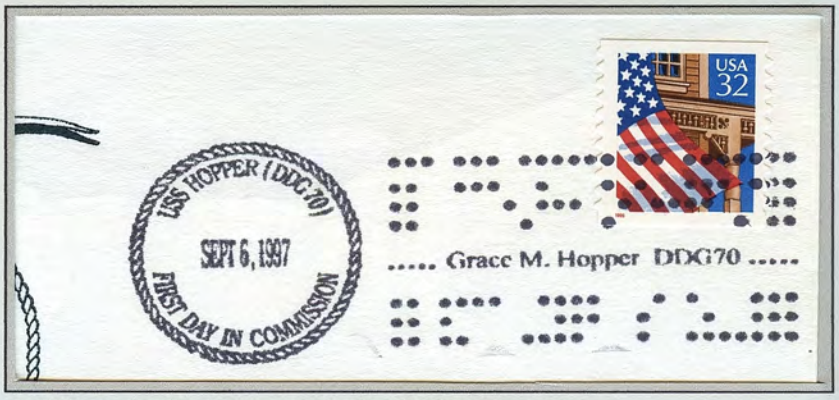


Postage due envelope (Netherlands - 1917): when a postcard was insufficient prepaid, it was presented to addressee in this envelope to pay the postage due. It prevented a common habit to read the message on the card and then refuse the card and this way to avoid paying for the postage. People are always in search of avoid paying for services.

Since the introduction of the PC at home. people were keen in finding free software, often illegal, as they always have tried to do. Still today video and music illegal downloads are a major problem.

A computer can only do the tasks for which it is programmed. When errors are detected, they are usually programming errors, "a bug".

Grace M.Hopper



USS Hopper ship (US); named after Grace M.Hopper

During the Mark-II programming project (1947) a navy maintenance engineer, **Grace M. Hopper**, defined as first a computer error as "bug" in a maintenance log. The little **moth** that got stuck in the relay and prevented working...

...correctly, got its immortality with its death. The **millennium bug** is the most famous year 2000 software problem.

'Poached Egg' Testing dummy labels (Great Britain - 1937); testing is vital to ensure smooth running. These labels were designed to enable Post Office engineers to simulate a live environment.

A computer program need testing and proof that it will run fine in all scenarios.

Letter Paris to Brussels (13.08.1777); cancelled with PARIS (Paris infinity cancel); used from April 1774 till May 1778

When badly tested, it can lead to a program looping endlessly or infinitely, either due to a program logic error (bug) or caused by wrong input or instructions. It results in computer "freezing"; others include thrashing or deadlock.

In the beginning programmers chose for a readable two-digit year date format when dates were stored on very expensive hardware. In the approach of the year 2000, trillion lines of code or records needed to be corrected and tested when date calculations turned out to be wrong and could cause errors.
'Year 2000 (**Y2K**) ready' means that a computer program performs date calculations correctly.

Baroda Philatelic Soc. Silver jubilee celebration cancel (India – 01.01.2000): depicting PC in new Millennium to share awareness of tangible chaos across the world. ►

A millennium bug could have caused chaos and by missing vital elements such as energy and products, business could have come to a halt.

◄ *copy of backside of stationery printed to order (Germany): postmarks on 31.12.99 and 1.1.00 with no century notification.*

Computers can't interpret automatically when a date is 100 years older. Above two-digit year date postmarks prove that only a human brain is able to detect the difference between 31.12.99 and 01.01.00. Computers can only interpret a four-digit year date format correct.

Occasional postmark (Germany): 5.9.1990.
4-digit year date format causes no misinterpretation.

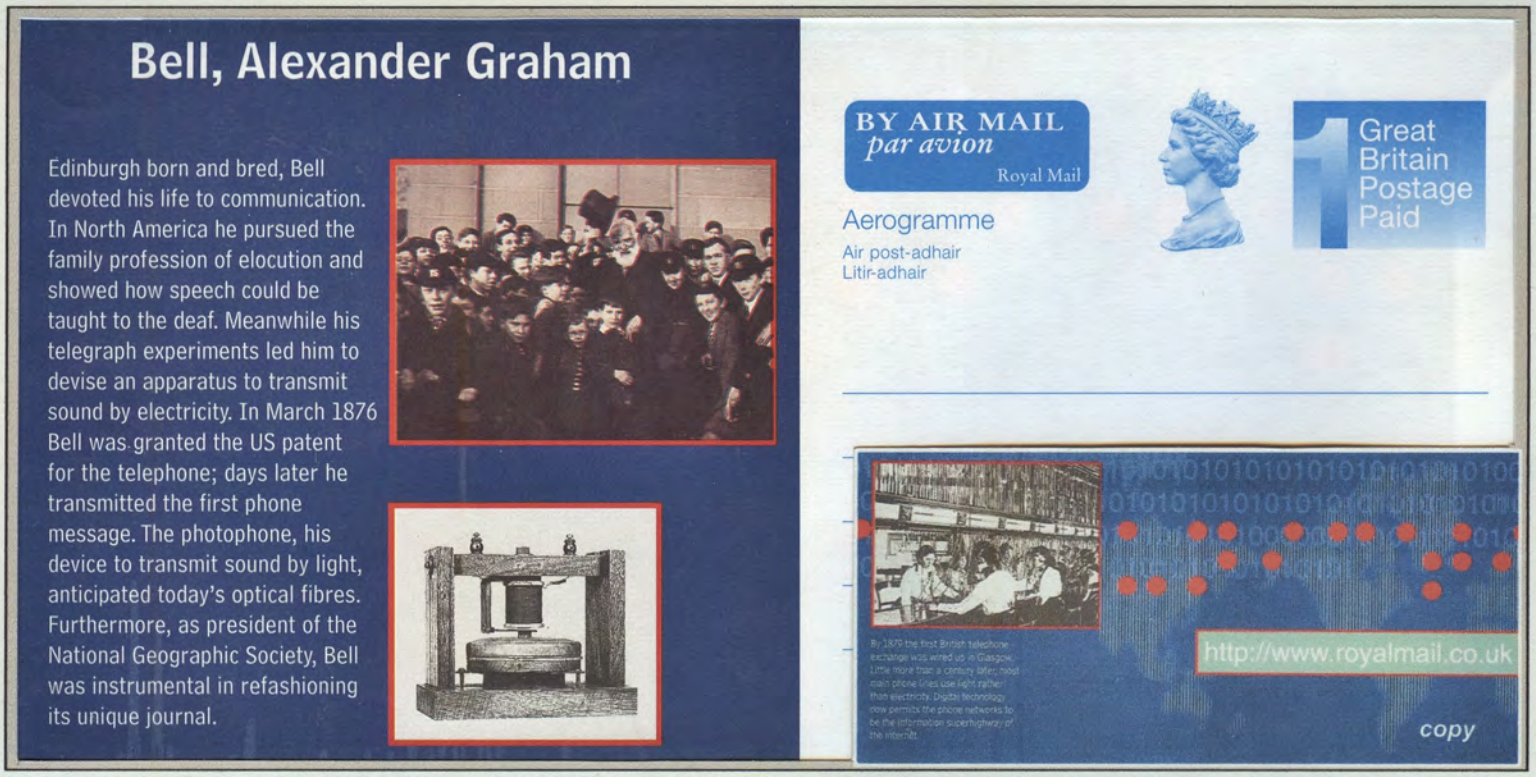
*Inflation letter (Germany) sent in 1923 from Siemensstadt to Duisburg (city nearby Berlin named after Von Siemens' company). Perfin SSW (**S**iemens-**S**chuckert **W**erke)*

Proof of studio (Paraguay): ill. first telegraph lines in 1860.

Werner Von Siemens (1816-1892) installed the first telegraph lines between Frankfurt and Berlin in 1848, and in Russia in 1850. With his brothers he went on to install lines between India and Europe, as well as across the Atlantic. Not only the Siemens company is named after him but also a whole city was named after him; ***Siemensstadt***.

Émile Baudot (1845-1903), French telegraph engineer and inventor of the multiplexed telegraph system, which means that multiple transmissions could be sent over a single line.

Alexander Graham Bell (1847-1922) was an eminent scientist, inventor, engineer and innovator, known for inventing the first practical telephone, by sending multiple tones on a telegraph wire. He also made groundbreaking work in optical telecommunications.

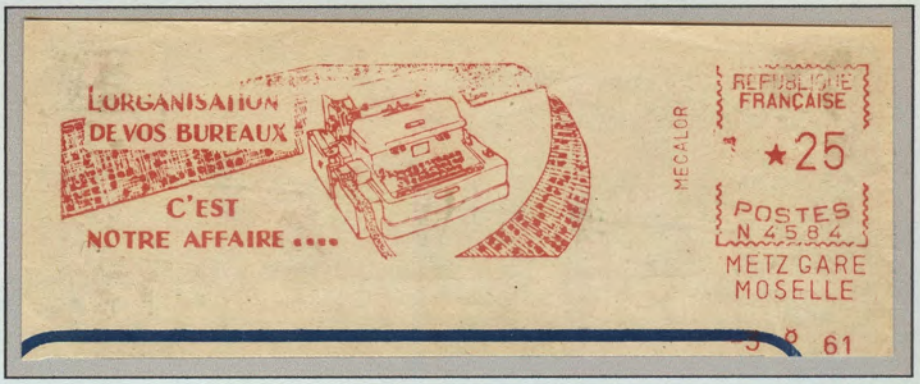


Aerogramme (Great-Britain) - Graham Bell stating; "The photo phone, his device to transmit sound by light. … a century later, most main phone lines use light rather than electricity. Digital technology now permits phone networks to be the information superhighway of the internet".

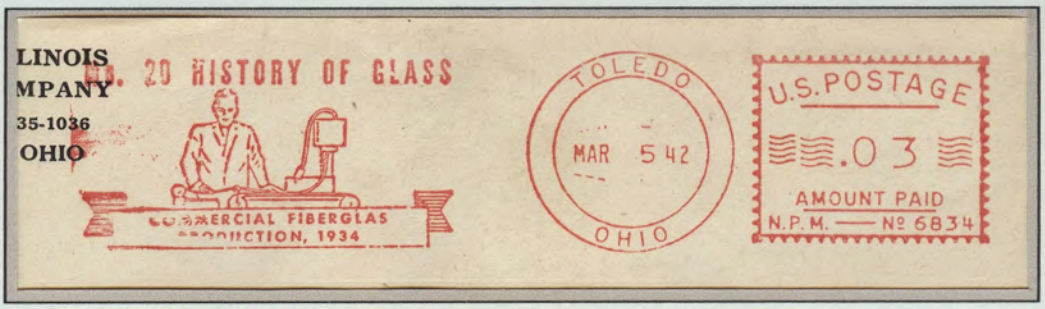
Telegram (Polish) 21.10.1927: Publicity Ericsson telephone and cable

Ericsson's company history dates back to 1876 when the founder, **Lars Magnus Ericsson** (1846-1926), opened a repair shop for telegraph equipment. Realizing that there was a need for improvements in the telephone instruments available at that time, he started his own production. He invented a switchboard to handle the growing number of telephones and lines. They also tried a few years in 1980-90 to sell PC's, but found out that their core business was selling telephones.

Telegram (Czech): Central equipped with telephone switchboard based on Ericsson model.



The telex network used the telephone network was extensively used worldwide by companies from the mid-1920s till the end-1980s. Telex machines could connect with and communicate with any other telex machines on a global scale and was also relatively secure in sending and receiving messages.

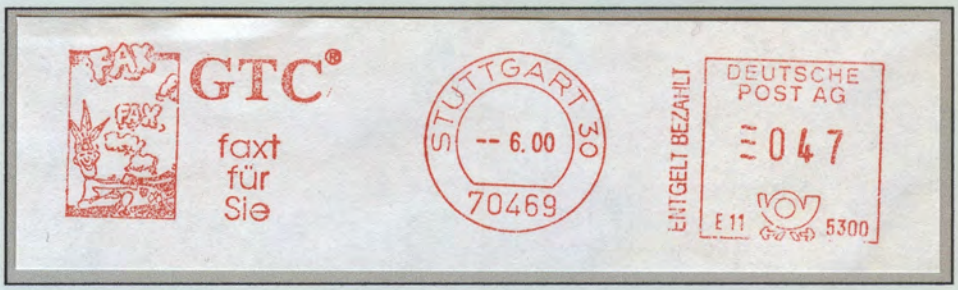


National Postal Meter multi-value (U.S.): early Fiberglass production

Until 1980s the entire telephone, telegraph and telex network was analogue. Today it is fully digital thanks to fiberglass, a product invented in 1932 for producing glass wool. The digital network protocol ISDN (Integrated Services Digital Network) became the standard allowing a copper wire or optical fiberglass (wire of glass) to carry fast and error-free voice, video and many other digital network services.

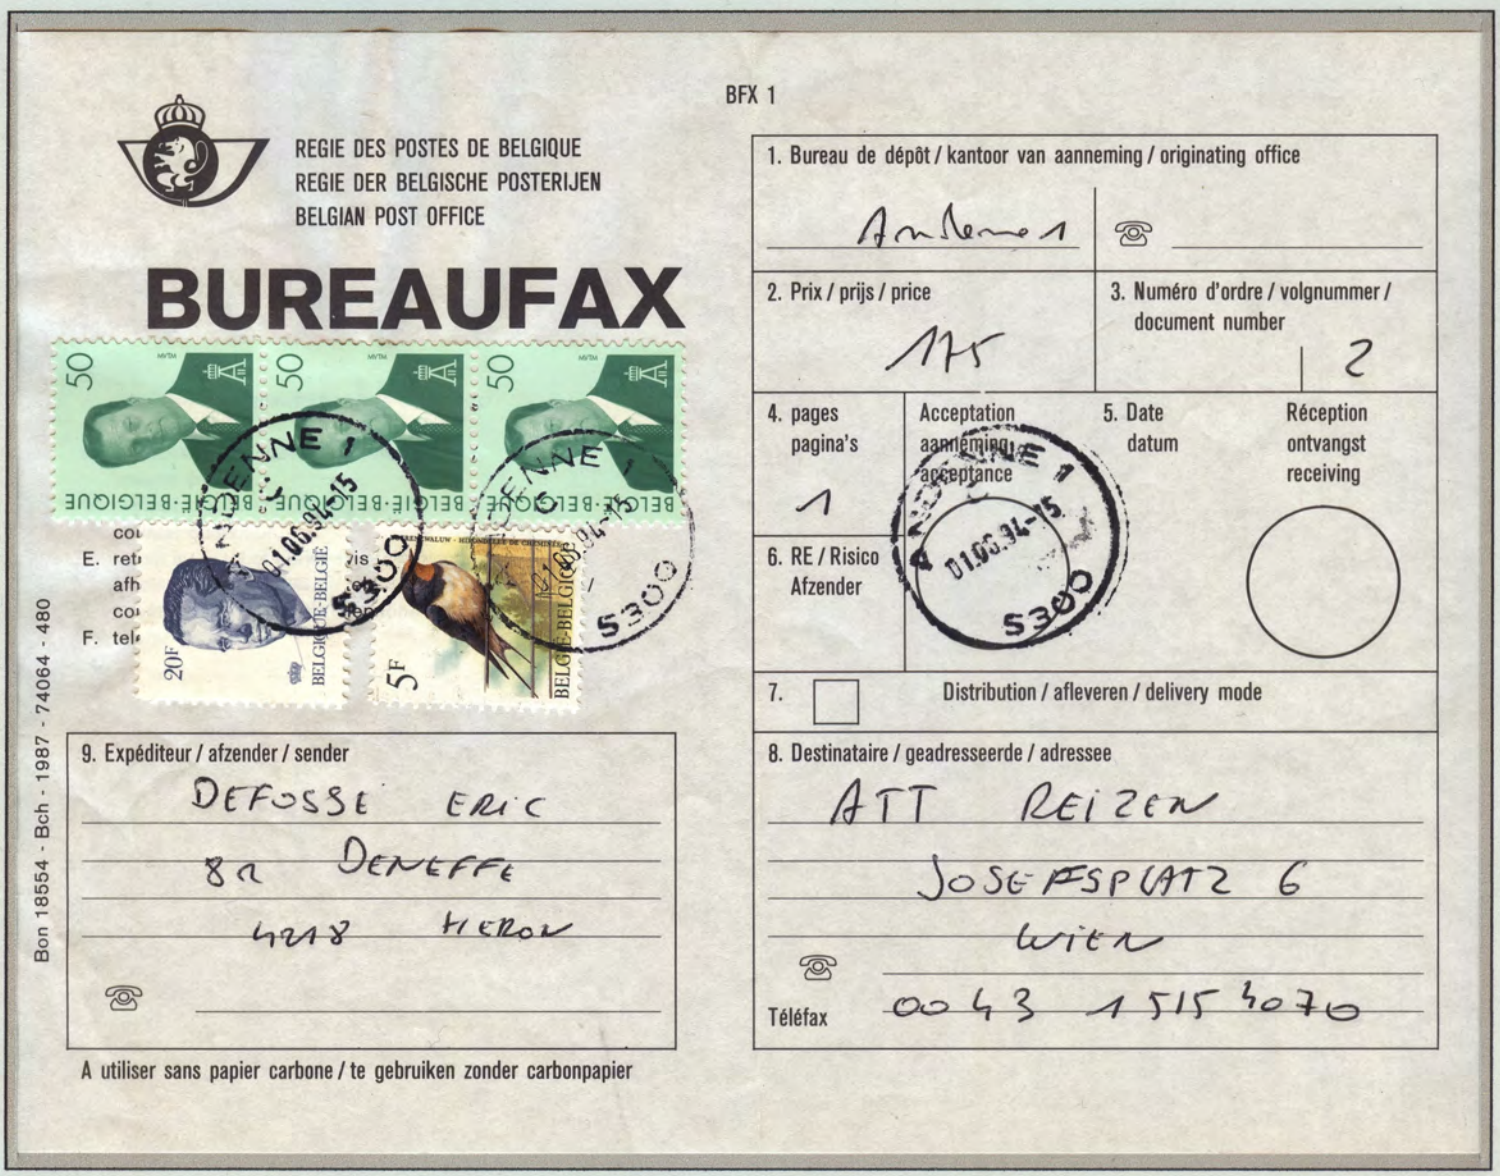
Telex punched stamp (Estonia-1991); Shortly after Estonia gained full independence, many post offices ran out of stamps. The city Tartu issued local provisional stamps on telex punch paper on 19 December 1991 only. They are never sold in mint condition and exist in sets of 16 stamps in three colours (white, light blue and dark blue).

4.2 Replacing the old copper network by fiber.

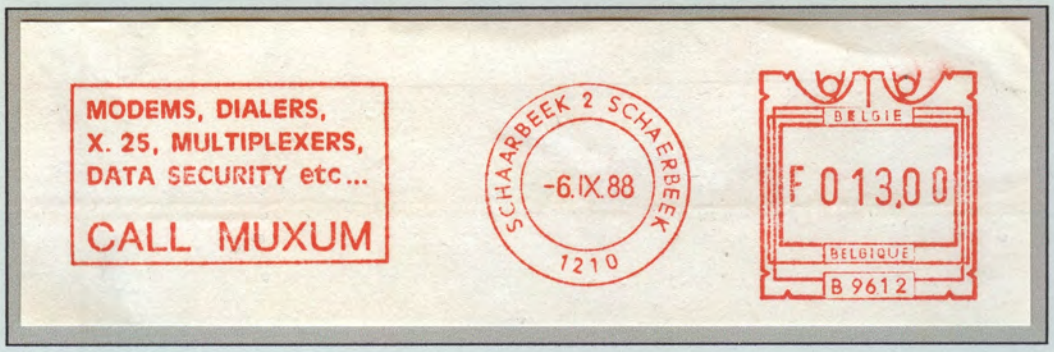


Pitney Bowes "6300" series (Germany): text: Fax messages

A fax machine makes a tele copy by scanning graphical pages including images and text, and converts the information into digital signals, transmitted via fast fiber lines to produce a paper copy of the graphics on the receiving fax machine. The growth in the market was prompted in Asian region by the pictorial nature of their language.



Telematic Fax service (Belgium) bureaufax document BFX1: serviced from 1 jan 1994 till 31 dec 1998 (national) – 31 aug 2001 (international). One page fax international sent (175BEF=4.33€) on 01.06.1994 from Andenne to Vienna (Austria).



The goal of a **modem** (constructed from ***mo***dulator and ***dem***odulator) is to (re)produce a signal containing data that can be transmitted fast. Different transmission protocols (shapes of packages sending a stream of bits) guarantees higher speed, availability, secured and quantity of bytes.

Cyan color proof ▶

For long distance communications applications a satellite in a geostationary orbit appears the fastest way. Since 1964 hundreds of communication satellites are in use worldwide.

Artwork (North Korea): satellite, satellite dish and man checking a terminal.

Satellites were introduced where wires weren't easy to place or to get. With satellite dishes pointing to a satellite easy transmission can be established served by radio waves over long distance without limits on capacity.

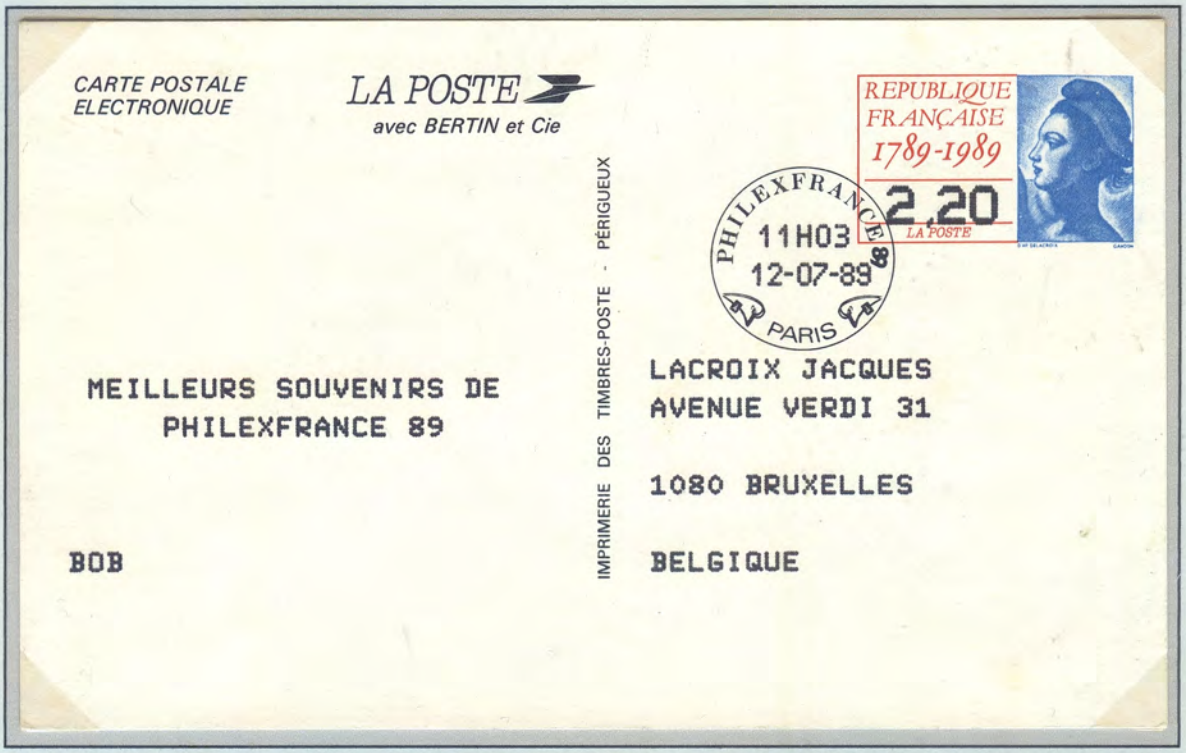
Local area network

Hasler "Mailmaster" (Germany)

Local area network

A LAN (local area network) connects workstations and personal computers and allows users to share devices, such as laser printers and storage. Users can also execute programs any-where on the network and communicate with others by sending e-mails or engaging chat sessions.



During the World Stamp Exhibition PhilexFrance '89 in Paris a network of 50 terminals and 2 central printers was set up. A pre-printed postal card was sent after printing the typed in address, chosen preferred message out of 4 standard ones, paying the calculated rate depending on the address and the date time stamp.

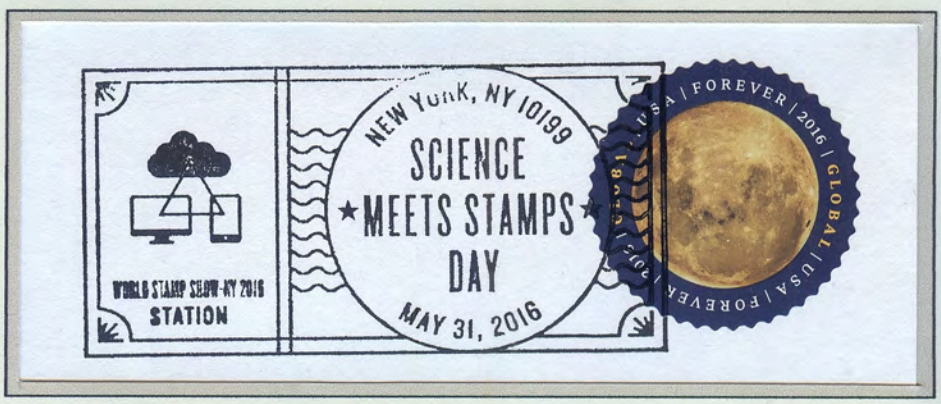
While lines for telephone are less in use due to mobile telephony, those lines are now in use for ISDN and DSL activity that allows the user to access the Internet at home.

Connectors

Wi-Fi connection



Wi-Fi and mobile connectivity thru wireless access introduced internet access in the Cloud; being "Cloud computing" and sharing data and software provided by service providers.

Bluetooth is summed up by this runic inscription from the Jelling stone.

Bluetooth is a wireless technology standard for exchanging data over short distances using short-wavelength and allow mobiles to link easily.
Bluetooth is an invention of Ericsson Company and gave it the name of a King called Blåtand who lived in the 10th century and united the Nordic countries.

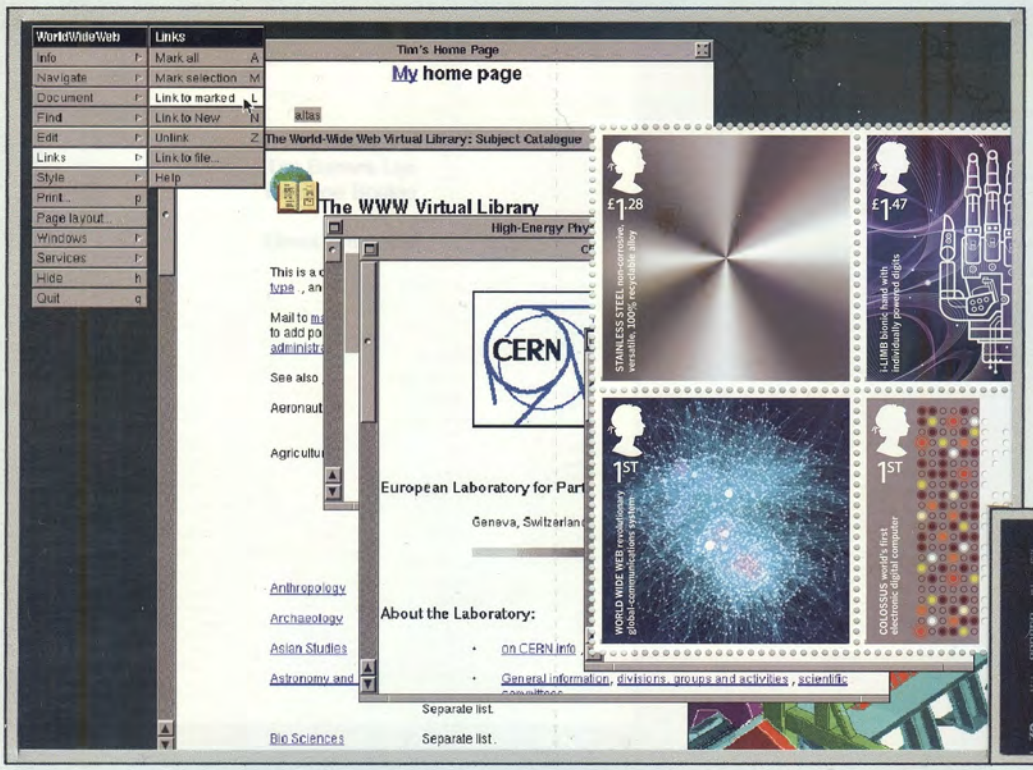
4.5 Wonderland Internet, one big world!

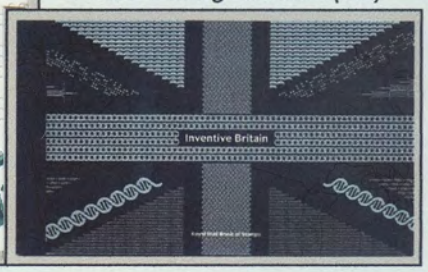
Invented by Barners Lee

The current global Internet was developed for the US Department of Defense as a reply to the atomic threat of the 70s. The goal was to build a global communication network based on TCP/IP (Transmission Control Protocol / Internet Protocol) to connect for non-commercial use.

Barners Lee



◀ *Pane Prestige Booklet (GB)*



Barners Lee invented the WWW (World Wide Web) by using the HTTP (Hypertext Transfer Protocol) client en server via the internet. The first successful communication was in Christmas 1990 while he was working at CERN. The language developed for this is called HTML (HyperText Markup Language) using hypertext and hyperlinks (link or URL; Uniform Resource Locator) for immediate access via displayable links.

Internet became commercial and caused a drastic impact on culture and commerce.

"Surfing the Internet" is a common expression; exploring the internet by following one interesting link after another, usually without a definite objective or search strategy.

An Internet café

The Internet, the worldwide web, became available everywhere in the world, both thru privately or company connectivity. It became popular due to the published information and advertisements against payment, the start of first commercial use and need, in an easy way.

Every country and global network groups got their own extension (top-level domain like .com).

◄ as an exception television channels wanted to have their own extension; they offered in 1998 the small country Tuvalu $50 million for using the .tv extension until 2048.

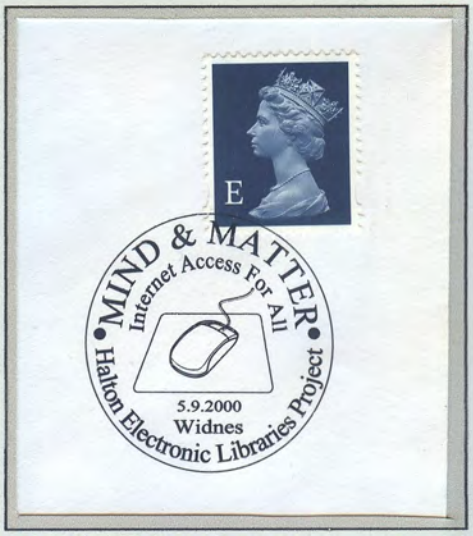
spam meat

You want to kiss someone

Billions of messages are sent every day and some Internet slang and symbols has been introduced like: BTW, kr, ;-), *^_^*, ^3^, etc.... ***emoji's, slogan hashtags*** and shortcuts save keystrokes for the sender.

emoji's

Spam was often misused to describe any canned meat product containing pork tasting horrible, all-over and inevitable, characteristics which led to its name being borrowed for unsolicited electronic messages, especially spam email.



The internet gives quite some wonderful possibilities to all of us such as; online shopping, e-business or e-commerce and all kinds of e-governance (government online services),.

@ : e-business or e-commerce sign

Today e-commerce trading (shopping) is recognized for its ability to allow business to communicate and to form transaction anytime and anyplace, where buyers or sellers rely on Internet-based technology.
